MULTI V III

Outdoor Unit R410A

SERVICE MANUAL

MODEL : ARUN Series

CAUTION

Before Servicing the unit, read the safety precautions in General SVC manual.
Only for authorized service personnel.

TABLE OF CONTENTS

Safety Precautions

To prevent injury to the user or other people and property damage, the following instructions must be followed.

■ Incorrect operation due to ignoring instruction will cause harm or damage. The seriousness is classified by the following indications.

⚠**WARNING**	This symbol indicates the possibility of death or serious injury.
⚠**CAUTION**	This symbol indicates the possibility of injury or damage to properties only.

■ Meanings of symbols used in this manual are as shown below.

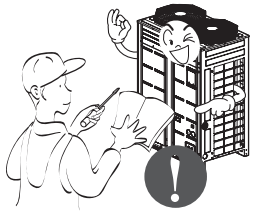
⃠	**Be sure not to do.**
❗	**Be sure to follow the instruction.**

⚠WARNING

■ Installation

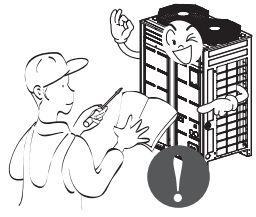
Have all electric work done by a licensed electrician according to "Electric Facility Engineering Standard" and "Interior Wire Regulations" and the instructions given in this manual and always use a special circuit.

- If the power source capacity is inadequate or electric work is performed improperly, electric shock or fire may result.



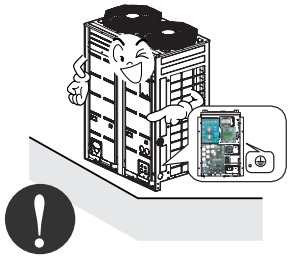
Ask the dealer or an authorized technician to install the air conditioner.

- Improper installation by the user may result in water leakage, electric shock, or fire.



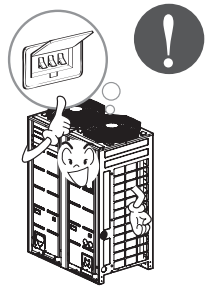
Always ground the product.

- There is risk of fire or electric shock.



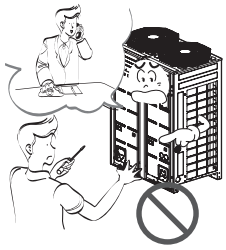
Always intstall a dedicated circuit and breaker.

- Improper wiring or installation may cause fire or electric shock.



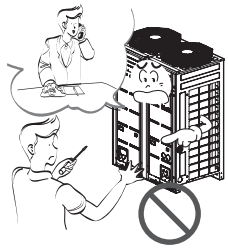
For re-installation of the installed product, always contact a dealer or an Authorized Service Center.

• There is risk of fire, electric shock, explosion, or injury.



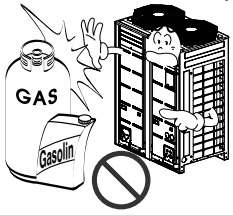
Do not install, remove, or re-install the unit by yourself (customer).

• There is risk of fire, electric shock, explosion, or injury.



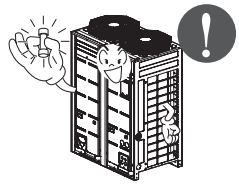
Do not store or use flammable gas or combustibles near the air conditioner.

• There is risk of fire or failure of product.



Use the correctly rated breaker or fuse.

• There is risk of fire or electric shock.

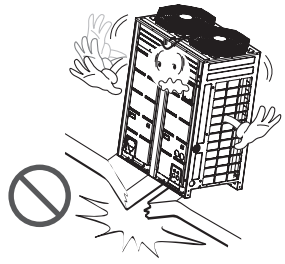


Prepare for strong wind or earthquake and install the unit at the specified place.

• Improper installation may cause the unit to topple and result in injury.

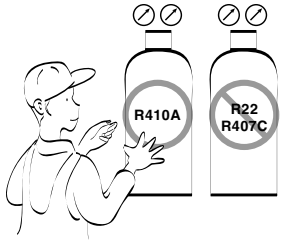
Do not install the product on a defective installation stand.

• It may cause injury, accident, or damage to the product.



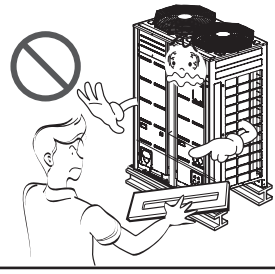
When installing and moving the air conditioner to another site, do not charge it with a different refrigerant from the refrigerant specified on the unit.

• If a different refrigerant or air is mixed with the original refrigerant, the refrigerant cycle may malfunction and the unit may be damaged.



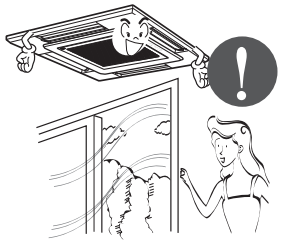
Do not reconstruct to change the settings of the protection devices.

• If the pressure switch, thermal switch, or other protection device is shorted and operated forcibly, or parts other than those specified by LGE are used, fire or explosion may result.



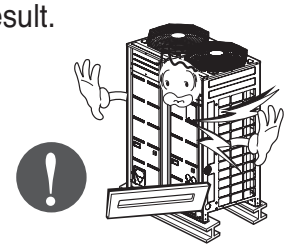
Ventilate before operating air conditioner when gas leaked out.

• It may cause explosion, fire, and burn.



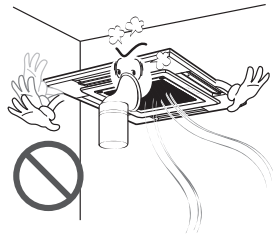
Securely install the cover of control box and the panel.

• If the cover and panel are not installed securely, dust or water may enter the outdoor unit and fire or electric shock may result.



If the air conditioner is installed in a small room, measures must be taken to prevent the refrigerant concentration from exceeding the safety limit when the refrigerant leaks.

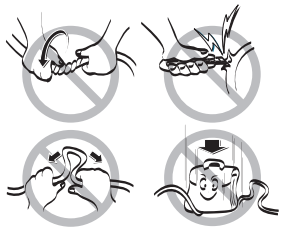
• Consult the dealer regarding the appropriate measures to prevent the safety limit from being exceeded. Should the refrigerant leak and cause the safety limit to be exceeded, harzards due to lack of oxygen in the room could result.



■ Operation

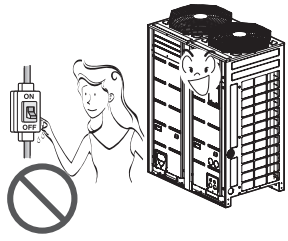
Do not damage or use an unspecified power cord.

• There is risk of fire, electric shock, explosion, or injury.



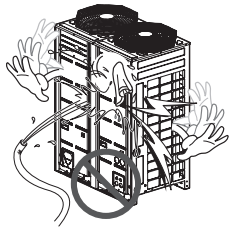
Use a dedicated outlet for this appliance.

• There is risk of fire or electrical shock.



Be cautious that water could not enter the product.

• There is risk of fire, electric shock, or product damage.

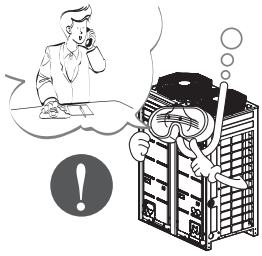


Do not touch the power switch with wet hands.

• There is risk of fire, electric shock, explosion, or injury.

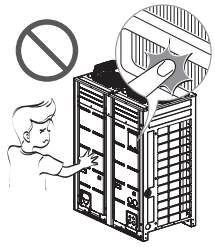
When the product is soaked (flooded or submerged), contact an Authorized Service Center.

• There is risk of fire or electric shock.



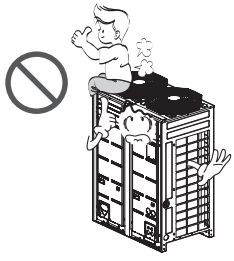
Be cautious not to touch the sharp edges when installing.

• It may cause injury.



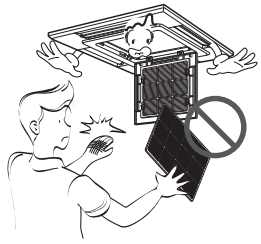
Take care to ensure that nobody could step on or fall onto the outdoor unit.

• This could result in personal injury and product damage.



Do not open the inlet grille of the product during operation. (Do not touch the electrostatic filter, if the unit is so equipped.)

• There is risk of physical injury, electric shock, or product failure.

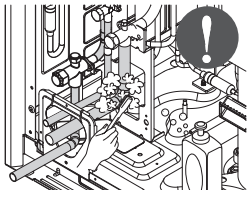


⚠ CAUTION

■ Installation

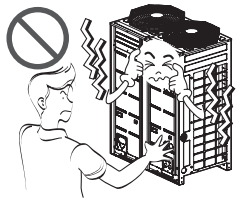
Always check for gas (refrigerant) leakage after installation or repair of product.

• Low refrigerant levels may cause failure of product.



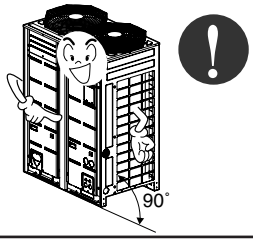
Do not install the product where the noise or hot air from the outdoor unit could damage the neighborhoods.

• It may cause a problem for your neighbors.



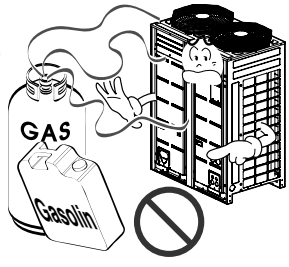
Keep level even when installing the product.

• To avoid vibration or water leakage.



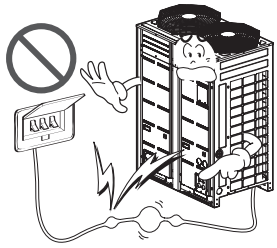
Do not install the unit where combustible gas may leak.

• If the gas leaks and accumulates around the unit, an explosion may result.



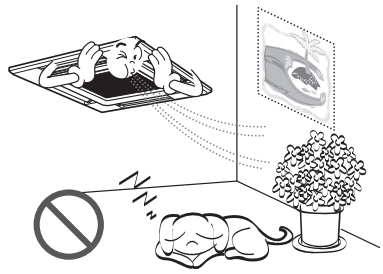
Use power cables of sufficient current carrying capacity and rating.

- Cables that are too small may leak, generate heat, and cause a fire.



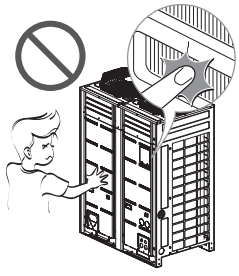
Do not use the product for special purposes, such as preserving foods, works of art, etc. It is a consumer air conditioner, not a precision refrigeration system.

- There is risk of damage or loss of property.



Keep the unit away from children. The heat exchanger is very sharp.

- It can cause the injury, such as cutting the finger. Also the damaged fin may result in degradation of capacity.

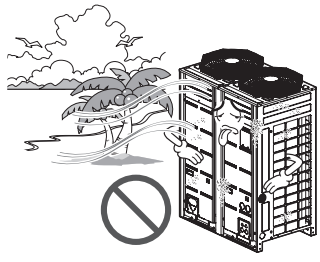


When installting the unit in a hospital, communication station, or similar place, provide sufficient protection against noise.

- The inverter equipment, private power generator, high-frequency medical equipment, or radio communication equipment may cause the air conditioner to operate erroneously, or fail to operate. On the other hand, the air conditioner may affect such equipment by creating noise that disturbs medical treatment or image broadcasting.

Do not install the product where it is exposed to sea wind (salt spray) directly.

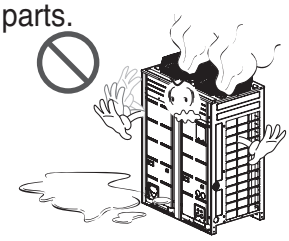
- It may cause corrosion on the product. Corrosion, particularly on the condenser and evaporator fins, could cause product malfunction or inefficient operation.



■ Operation

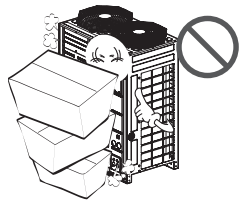
Do not use the air conditioner in special environments.

• Oil, steam, sulfuric smoke, etc. can significantly reduce the performance of the air conditioner or damage its parts.



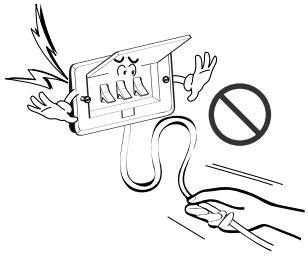
Do not block the inlet or outlet.

• It may cause failure of appliance or accident.



Make the connections securely so that the outside force of the cable may not be applied to the terminals.

• Inadequate connection and fastening may generate heat and cause a fire.



Be sure the installation area does not deteriorate with age.

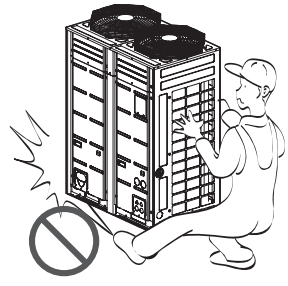
• If the base collapses, the air conditioner could fall with it, causing property damage, product failure, or personal injury.

Install and insulate the drain hose to ensure that water is drained away properly based on the installation manual.

• A bad connection may cause water leakage.

Be very careful about product transportation.

• Only one person should not carry the product if it weighs more than 20 kg.
• Some products use PP bands for packaging. Do not use any PP bands for a means of transportation. It is dangerous.
• Do not touch the heat exchanger fins. Doing so may cut your fingers.
• When transporting the outdoor unit, suspending it at the specified positions on the unit base. Also support the outdoor unit at four points so that it cannot slip sideways.

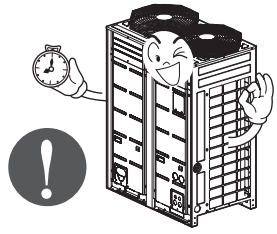


Safely dispose of the packing materials.

- Packing materials, such as nails and other metal or wooden parts, may cause stabs or other injuries.
- Tear apart and throw away plastic packaging bags so that children may not play with them. If children play with a plastic bag which was not torn apart, they face the risk of suffocation.

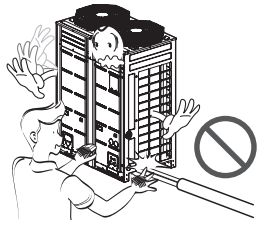
Turn on the power at least 6 hours before starting operation.

- Starting operation immediately after turning on the main power switch can result in severe damage to internal parts. Keep the power switch turned on during the operational season.



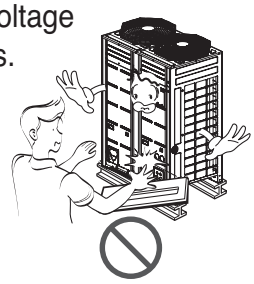
Do not touch any of the refrigerant piping during and after operation.

- It can cause a burn or frostbite.



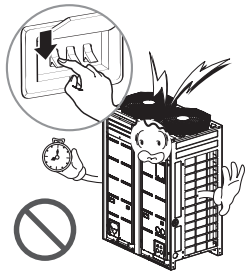
Do not operate the air conditioner with the panels or guards removed.

- Rotating, hot, or high-voltage parts can cause injuries.

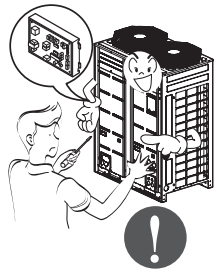


Do not directly turn off the main power switch after stopping operation.

- Wait at least 5 minutes before turning off the main power switch. Otherwise it may result in water leakage or other problems.

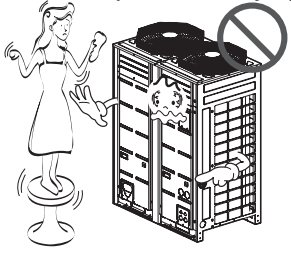


Auto-addressing should be done in condition of connecting the power of all indoor and outdoour units. Auto-addressing should also be done in case of changing the indoor unit PCB.



Use a firm stool or ladder when cleaning or maintaining the air conditioner.

- Be careful and avoid personal injury.



Do not insert hands or other objects through the air inlet or outlet while the air conditioner is plugged in.

- There are sharp and moving parts that could cause personal injury.

ARUN408DT3	40(34)	3			1	2
ARUN432DT3	42(36)	3				3

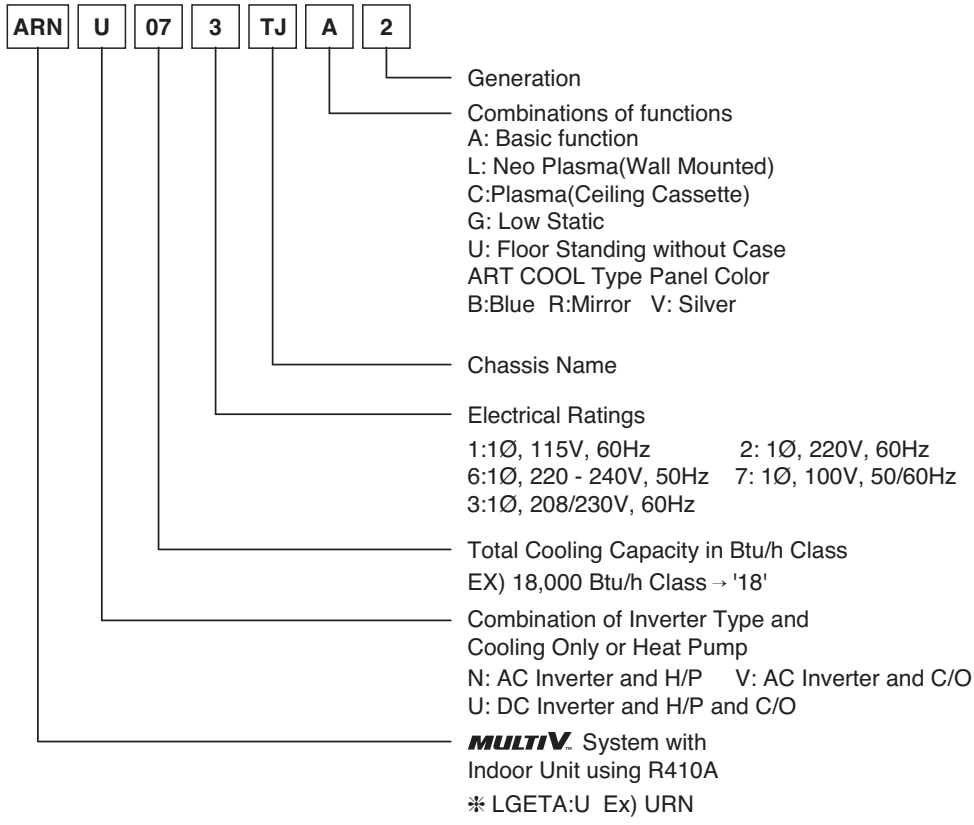
■ A maximum of 42HP can be obtained by combining 8, 10, 12 and 14HP

■ The biggest module should be master module and others are slaves.

■ Setting method of master/slave and position of master in the system is explained in the installation chapter.

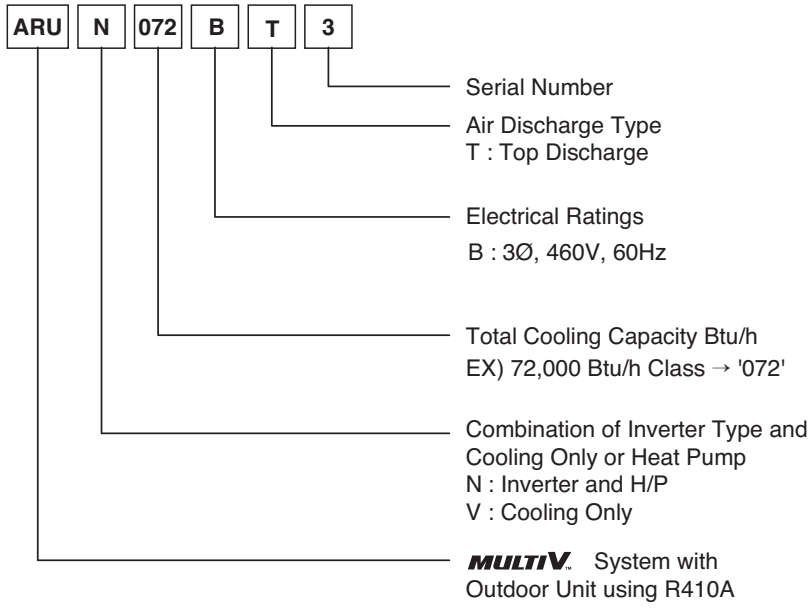
4. Nomenclature

4.1 Indoor Unit



❊ Heat recovery ventilator refer to the DX-Coil manual

4.2 Outdoor Unit



Part 2
Outdoor Units

ARUN Series

Function

1. Basic control

1.1 Normal operation

Actuator	Cooling operation	Heating operation	Stop state
Compressor	Fuzzy control	Fuzzy control	stop
Fan	Fuzzy control	Fuzzy control	stop
Main EEV	Full open	Fuzzy control	Min. pulse
Subcooling EEV	Fuzzy control	• Normal : minimum pulse • Avoiding control of high discharge temperature	Min. pulse
Indoor Unit EEV	Superheat fuzzy control	Subcooling fuzzy control	Min. pulse

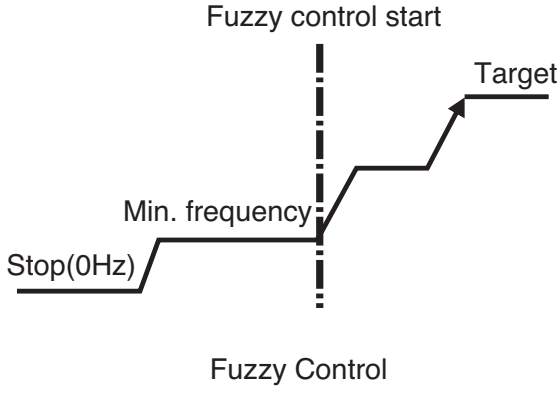
Note : Heating operation is not functional at an outdoor air temperature of 24°C or more.
Cooling operation is not functional at an outdoor air temperature of 2°C or less with indoor unit combination of 10% or less

1.2 Compressor control

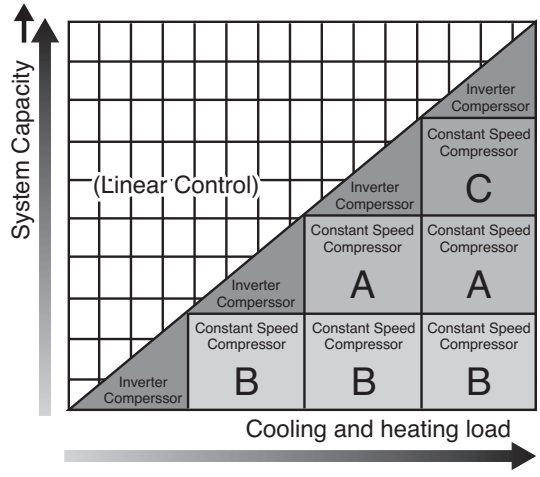
Fuzzy control : Maintain evaporating temperature(Te) to be constant on cooling mode and condensing temperature(Tc) on heating mode by Fuzzy control to ensure the stable system performance.
(Tc:47 ~51°C, Te:2 ~ 5°C)
(1) Cooling mode
Te can be set by initial dip switch setting. (Normal mode, capacity up mode, and energy save mode)

(2) Heating mode
Tc can be set by initial dip switch setting. (Normal mode, capacity up mode, and energy save mode)

Note: By setting dip switch, Te and Tc are decided simultaneously.



Fuzzy Control



Inverter linear control as cooling and heating load increasing

1.3 Master and slave Unit's EEV control

(1) Main EEV control
Main EEV operates with fuzzy control rules to keep the degree of super Heat(Superheat) (about 3°C)at the evaporator outlet stable during heating mode
The degree of Superheat = Tsuction - Tevaporation
Tsuction : temperature at suction pipe sensor(°C)
Tevaporation : evaporation temperature equivalent to low pressure(°C)

(2) Subcooling EEV control(about 15°C)
Subcooling EEV works with fuzzy rules to keep the degree of Subcool at the outlet of subcooler during cooling mode
The degree of Subcool = Tcondensation - Tliquid
Tliquid : temperature at outlet of subcooler(°C)
Tcondensation : condensation temperature equivalent to high pressure(°C)

(3) Avoiding excessive high discharge temperature : when main EEV opens some given opening (R22 : 1000pls, R410A : 800 pls) and discharge temperature is above 90°C in heating operation, subcooling EEV may control the "subcooling out temperature-evaporating temperature" to be some given difference.

2. Special control

2.1 Oil return control

2.1.1 Oil return control on cooling mode

Oil return operation recovers oil amount in compressor by collecting oil accumulated in pipe.
Each cycle component operates as shown on the below table during oil return operation.

Outdoor Unit

Component	Starting	Running	Ending
Inv Compressor	30Hz	Setting Value	30Hz
Constant Speed Compressor	OFF	ON	OFF
FAN	Normal control	Normal control	Normal control
Main EEV	Max. pulse	Max. pulse	Max. pulse
Subcooling EEV	Normal control	Min. pluse	85 pulse
4way valve	OFF	OFF	OFF
Hot gas bypass valve	Normal control	Normal control	Normal control

Indoor Unit

Component	Starting	Running	Ending
Fan	Normal control	OFF	Normal control
Thermo on unit EEV	Normal control	Normal control	Normal control
Thermo off unit EEV	40 pulse	400 pulse	40 pulse
Oil return signal	OFF	ON	OFF

- Oil return operation time : 3 min for running step
- Starting condition:every 8 hours operate
- Oil return process ends if compressor protection control starts

2.1.2 Oil return control on heating mode

Outdoor Unit

Component	Starting	Running	Ending
Inv Compressor	50Hz	Setting Value	50Hz
Constant Speed Compressor	OFF	ON	OFF
FAN	Normal control	Normal control	Normal control
Main EEV	Max. pulse	Max. pulse	Max. pulse
Subcooling EEV	Normal control	Min. pulse	100 pulse
4way valve	ON	OFF	ON
Hot gas bypass valve	Normal control	Normal control	Normal control

Indoor Unit

Component	Starting	Running	Ending
Fan	Normal control	OFF	Normal control
Thermo on unit EEV	Normal control	400~800 pulse	Normal control
Thermo off unit EEV	80~130 pulse	400~800 pulse	80~130 pulse

- Oil return operation time : 3 min for running step
- Starting condition:same as cooling mode
- Oil return process ends if compressor protection control starts

2.2 Defrost

Defrost operation eliminates ice accumulated on heat exchanger, recovering performance of heat exchanger.
Each cycle component operates as following table during defrost operation.

Outdoor Unit

Component	Starting	Running	Ending
Inv Compressor	30Hz	Setting Value	30Hz
Constant Speed Compressor	OFF	ON	OFF
FAN	Stop	High pressure control	Normal control
Main EEV	Normal control	Max. pulse	Normal control
Subcooling EEV	Normal control	Min. pulse	Normal control
4way valve	On ’ OFF	OFF	ON
Hot gas bypass valve	Normal control	Normal control	Normal control

Indoor Unit

Component	Starting	Running	Ending
Fan	OFF	OFF	OFF
Thermo on unit EEV	Normal control	400~800 pulse	Normal control

■ Ending condition

1) All heat exchanger pipe temperature are above setting temperature for 30 sec.
2) The running time of defrost operation is over 30% of the total heating time
3) If compressor protection control starts by high discharge temperature of compressor etc.

2.3 Stopping operation

2.3.1 Stopping operation on cooling mode

Component	Operation	Note
Inv Compressor	OFF	-
Constant Speed Compressor	OFF	-
FAN	Stop	-
Main EEV	50 pulse	Stop(Min. pulse)
Subcooling EEV	35 pulse	Stop(Min. pulse)
4way valve	OFF	-
Hot gas bypass valve	OFF	OFF after 15 min.

2.3.2 Stopping operation on heating mode

Component	Operation	Note
Inv Compressor	OFF	-
Constant Speed Compressor	OFF	-
FAN	Stop	-
Main EEV	50 pulse	-
Subcooling EEV	35 pulse	Stop(Min. pulse)
4way valve	ON	OFF over 30C air temperature
Hot gas bypass valve	OFF	OFF After 15 min.

2.4 Oil equalizing control

This function prevent oil unbalance between inverter. compressor. and constant speed compressor.

Compressor discharge temperature - Compressor oil temperature ≥ Standard oil temperature
Compressor oil temperature : Compressor oil balance temperature where the end of capi.

3. Protection control

3.1 Pressure protection control

3.1.1 Pressure control on cooling mode

■ **High pressure control**

Pressure Range	Compressor	Fan
$P_d \geq 4003$ kPa	Stop	Stop
$P_d > 3807$ kPa	-5Hz/ 4sec.	+100RPM/4sec.
$P_d \geq 3644$ kPa	Frequency holding	Normal control
$P_d < 3644$ kPa	Normal control	

■ **Low pressure control**

Pressure Range	Compressor	Fan
Ps ≤ 150kPa, 1 minute later operation	Stop	Stop
Ps ≤ 346kPa, 1 minute before operation	-5Hz/4s	-100RPM/ 4sec.
$P_s \leq 399$kPa	Normal control	Frequency holding

❊ Frequency holding : frequency (or RPM) is not increasing (can decrease)

3.1.2 Pressure control on heating mode

■ **High pressure control**

Pressure Range	Compressor	Fan
$P_d \geq 4003$ kPa	Stop	Stop
$P_d > 3415$ kPa	-5Hz/4sec.	-50RPM/ 4sec.
$P_d \geq 3317$ kPa	Normal control	Frequency holding
$P_d < 3317$ kPa	Normal control	$P_d < 3284$ N/control

Pressure Range	Compressor	Fan
Ps ≤ 150kPa, 1minute after operation	Stop	Stop
Ps < 150kPa, 1minute before operation	Inv. Minimum freq. + STD Comp. Off	+100RPM/10sec
Ps < 165kPa, befre 1 minute	Inv. -15Hz / 10sec	
Ps > 190kPa	Inv. freq. change limite, less than 5Hz	
Ps > 203kPa	Normal Control	

3.2 Discharge temperature control

■ **Outdoor unit control**

Temperature range	Compressor	Sub cooling EEV	IDU EEV
Tdis >115C	Off	SC,SH decrease control	SH decrease control
Tdis >108C	-5Hz/10sec.	SC,SH decrease control	SH decrease control
Tdis >100C	Normal control	SC,SH decrease control	SH decrease control

SC : Sub Cooling, SH : Super Heating

3.3 Inverter protection control

	Normal Operation	Frequency Down	System Stop
AC Input Current	33A or less	33A or more	35A or more
Compressor Current	34A or less	34A or more	40A or more

❉ AC input current is input current of inverter compressor except constant current (current pass through noise filter)

3.4 Phase detection

■ **When the product is reversed or missed wiring installation(Power line : R, S, T), it isn't defect or operate for protection of product function and constant speed compressor.**

Reversed Phase	R,S,T	Single	M		
			541		
		Series	M	S1	S1
			541	542	542
			M+S1(at the same time)	M+S2(at the same time)	
			542	543	543
			M+S1+S2(at the same time)		
			543		
Missed Phase	R,T	Single	M		
			501		
		Series	M	S1	S2
			501	502	503
			M+S1(at the same time)	M+S2(at the same time)	
			502	503	503
			M+S1+S2(at the same time)		
			503		
	S	Single	M		
			231		
		Series	M	S1	S2
			231	232	233
			M+S1(at the same time)	M+S2(at the same time)	
			232	233	233
			M+S1+S2(at the same time)		
			233		

3.5 Pressure switch

- Main has pressure sensing switch in series between compressor and power relay.
- The state of pressure sensing switch is normally on. It has small electric current from 220V AC. Never touch the connecting terminal with hand nor short two wires directly.

4. Other control

4.1 Initial setup

There are 4 initial setup steps before running.
All DIP switch setting must be completed before initial setup.

1) Step 1 : factory setting value display
Factory setting value is displayed in 7 segment on PCB for 24sec.
All dip switches must be set properly before step 1.

Power is on	
Master model code is displayed (3sec)	
Slave1 model code is displayed (3sec)	
Slave2 model code is displayed (3sec)	
Total capacity including sub units is displayed (2sec)	
Heat pump : Display 2 is default value Cooling only : no display	
Factory setting(25 is normal)	
Model type	

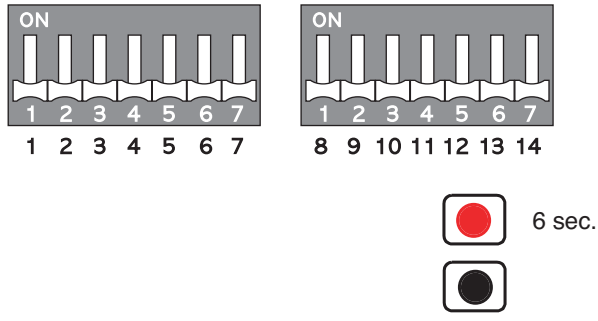
2) Step 2 : Communication check
- If all model code is displayed in 7 segment including all Slave unit, communication between outdoor units is normal.
- If 104* is displayed in 7-segment, check communication wires between outdoor units and Dip switch setting.

3) Step 3 : PCB error check
- After 40 sec, error check begins.

■ Master/ Slave unit
- All errors of units including Slave units are displayed in 7 segment.
- If communication between main PCB and inverter PCB isn't normal, 52* is displayed in 7-segment
  If communication between main PCB and fan PCB isn't normal, 105* is displayed in 7-segment.
  If error is displayed, check corresponding wires.

4) Step 4 : Auto addressing of indoor units
- Auto addressing begins when address(red) button in Main PCB is pressed for 6 sec.
- During auto addressing, 7 segment on main PCB displays "88"
- After auto addressing, the number of indoor units is displayed in 7 segment for 30 sec. The address of each indoor unit is displayed on each wired remote controller.

Push address(red) button for 6 sec.



Auto address starts

Auto address is in progress (max. 15 min.)

The number of indoor units is displayed for 30 sec.

(35 indoor units found)

Auto address process is finished.
Every indoor unit displays its address on wired remote controller and the 7 segment of main PCB is off.

4.2 Emergency operation

- If a compressor is out of order, the system can be run except the defective compressor by backup function.

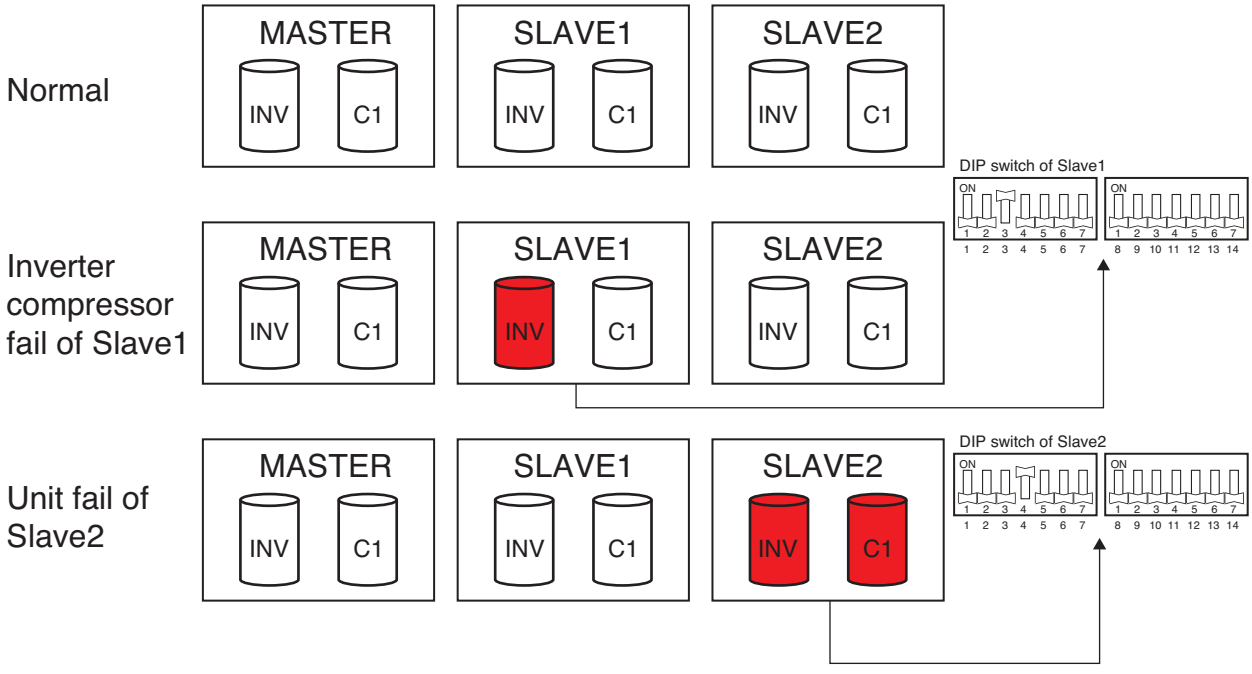
■ Automatic emergency operation(automatic back up function)

If outdoor unit detect comp defect during operation,, automatic back up mode is set.

1) Inverter compressor automatic emergency operation.
2) Constant compressor automatic emergency operation.

■ Manual emergency operation(Manual back up function)

1) Check which compressor is broken.(refer to °∞Trouble Shooting Guide°±)
2) Turn off the power.
3) Set the dip S/W of defective outdoor unit.
   - Inverter compressor defect : dip S/W No.3
   - Unit defect : dip S/W No.4
4) Turn on the power.



CAUTION

Emergency operation with inverter compressor failure should not last 48 hours. → It causes other compressor failure.

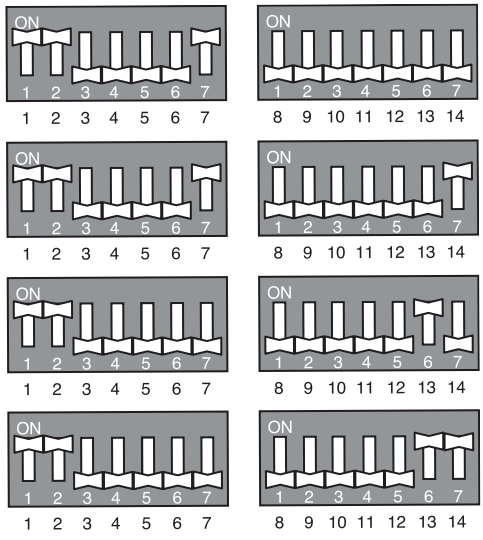
During the emergency operation, cooling/heating capacity may be lower.

4.3 Sensor checking function Note 1)

• If you set the Dip switch when power is on, the changed setting will not be applied immediately. The changed setting will be enabled only when Power is reset or by pressing Reset button.

DIP Switch Settings

Heat pump



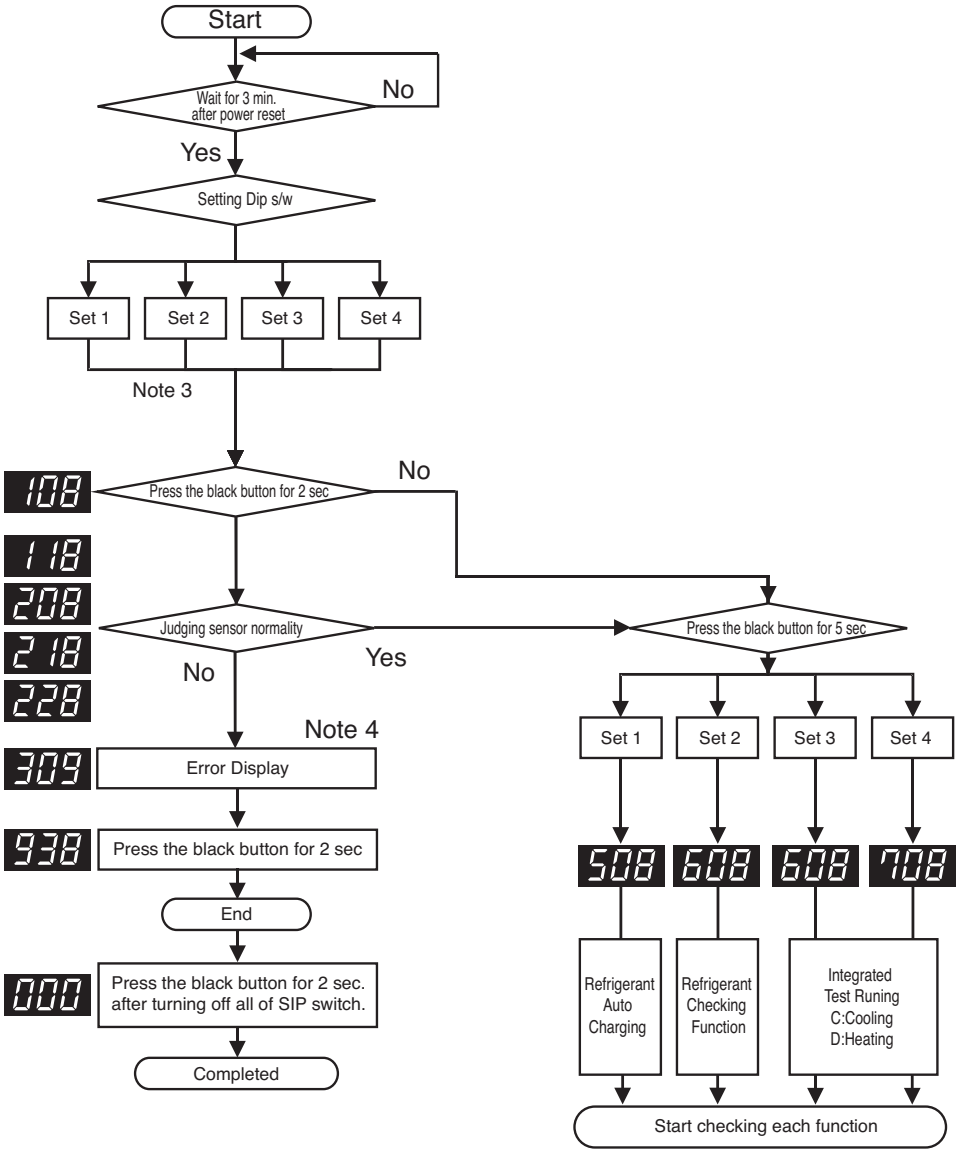
- Setting1
(Refrigerant Auto Recharge)

- Setting2
(Refrigerant Quantity Auto Decide)

- Setting3
(Integrated Test Run - cooling)

- Setting4
(Integrated Test Run - heating)

Warning : Please reset Main PCB before starting this function



Note

1. Sensor checking function is used with refrigerant checking and refrigerant auto charging.

	UX2 (1 Comp)	UX3 (2 Comp)
No. or sensor	6	7

2. Check abnormal sensor.
3. It is displayed at the LED on the main PCB at each step.
4. Reference the sensor error in next page.

CAUTION

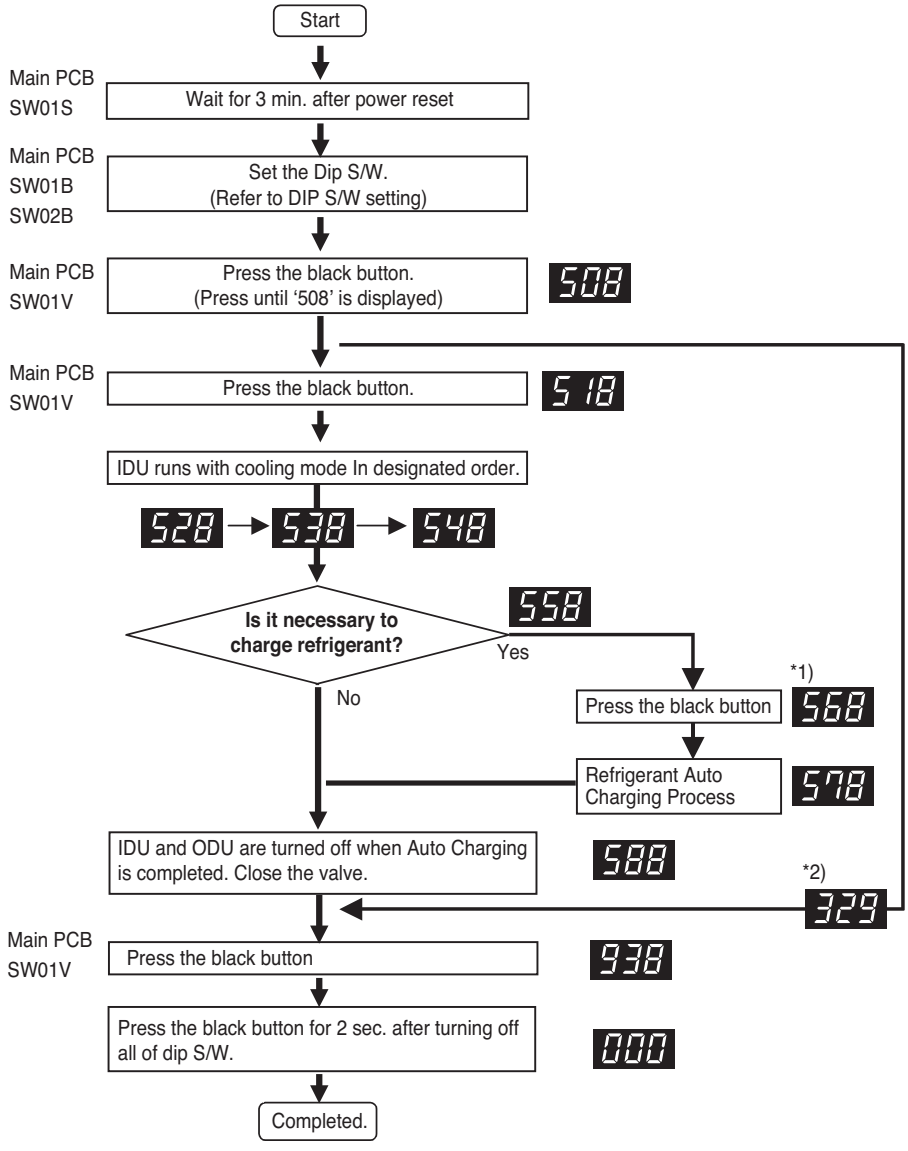
1. Confirm auto addressing has been performed (Check installed number of IDU).

2. The error can be displayed even if the sensor is normal according to installation and temperature condition. If error occurs, check the sensor and judge abnormality.

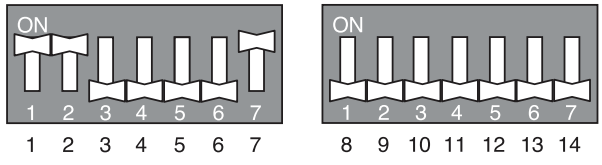
4.4 Refrigerant Auto Charging (Set 1)

This function charges appropriate amount of refrigerant automatically through cycle operation.
It can be used when refrigerant amount Isn't certain because of SVC and leakage.

※ Refrigerant charging time is depending on charging amount. (Charging time : About 3min/Kg)



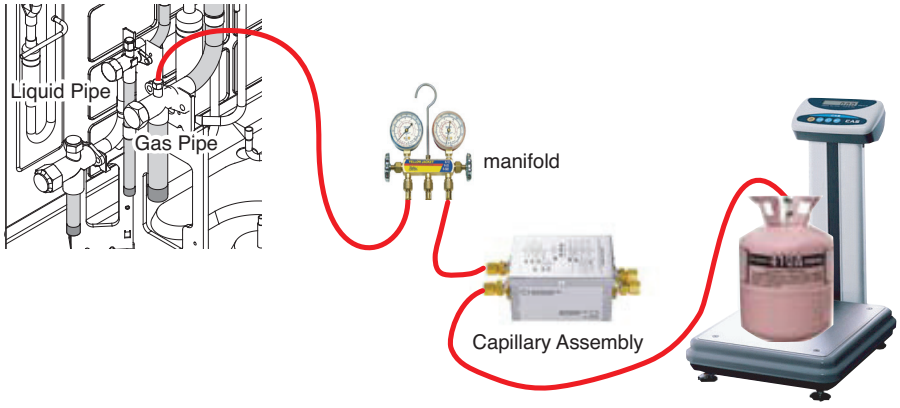
DIP Switch Settings



Warning : Please reset Main PCB before starting this function

Note

1. After installing the refrigerant charging device, 568 as shown in figure, open the valve
2. In case air temperature is out of guaranteed temperature, it may end without performing Auto charging
3. Refrigerant charging Time may change according to the charging amount. (Abt. 1.5min/lb)



Procedure

1. Arrange manifold,capillary assembly, refrigerant vessel and scale
2. Connect manifold to the gas pipe service valve of ODU as shown in the figure.
3. Connect manifold and Capillary tube.
Use designated capillary assembly only.
If designated capillary assembly isn't used, the system may get damaged.
4. Connect capillary and refrigerant vessel.
5. Purge hose and manifold.
6. After  **Is displayed, open the valve and charge the refrigerant**

■ Error contents about auto refrigerant charging function

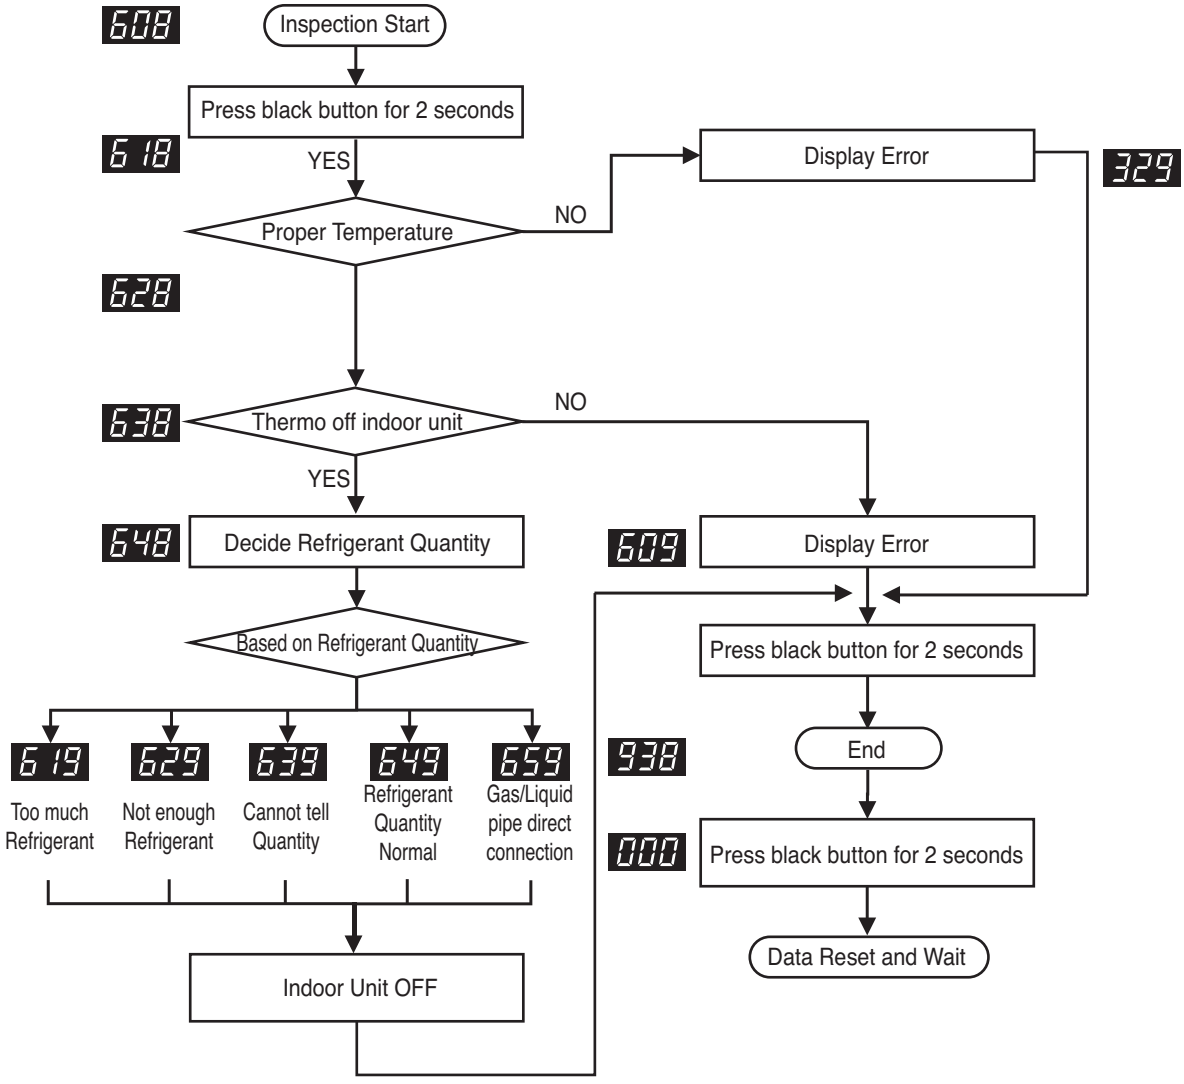
1.  : Temperature Range Error (In case that IDU or ODU is out of range)
2.  : Low Pressure Descent Error (In case the system runs at low pressure limit for over 10 minutes)
3.  : Judging rapid refrigerant inflow (In case the liquid refrigerant flows in because of not using designated Capillary Assembly)
4.  : Instability Error(In case the high/low pressure target doesn't get satisfied for some time after the starting operation)

CAUTION

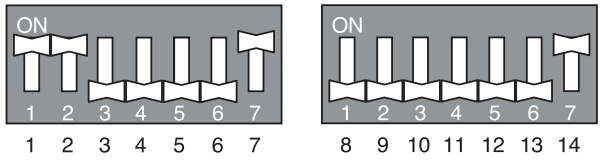
1. Guaranteed temperature range (Error will occur if temperature is out of range)
IDU : 20~32°C
ODU : 0~43°C
(this temperature range is specifically for accurate refrigerant charging)
2. For refrigerant charging, use designated device only. (Capillary Assembly Set)
3. Set the IDU wired remote controller temperature sensing mode as IDU
4. Be careful that IDU should not be thermo off.

4.5 Refrigerant Checking Function (Set 2)

This function judges refrigerant leakage and overcharging
It can be used with refrigerant auto charging function.



DIP Switch Settings



Warning : Please reset Main PCB before starting this function

Note

1. In case air temperature is out of guaranteed temperature, refrigerant checking function may end without performing refrigerant checking. Use guaranteed temperature range only.
2. During the process of judging refrigerant amount, if the cycle isn't stable, refrigerant checking function may end without performing refrigerant checking.

CAUTION

1. **Guaranteed Temperature range(Error occurs out of guaranteed temperature range)**
   IDU : 20~35°C
   ODU : 0~43°C
2. **Set IDU wired remote controller temperature sensor setting as 'IDU'.**
3. **Make certain that IDU doesn't run with thermo off mode during operation.**

[Error contents about auto refrigerant charging function]

1. 329 : Temperature Range Error (In case that IDU or ODU is out of range)
2. 609 : System Unstable Error (In case, After 45 min operating the system, it does not be stable)

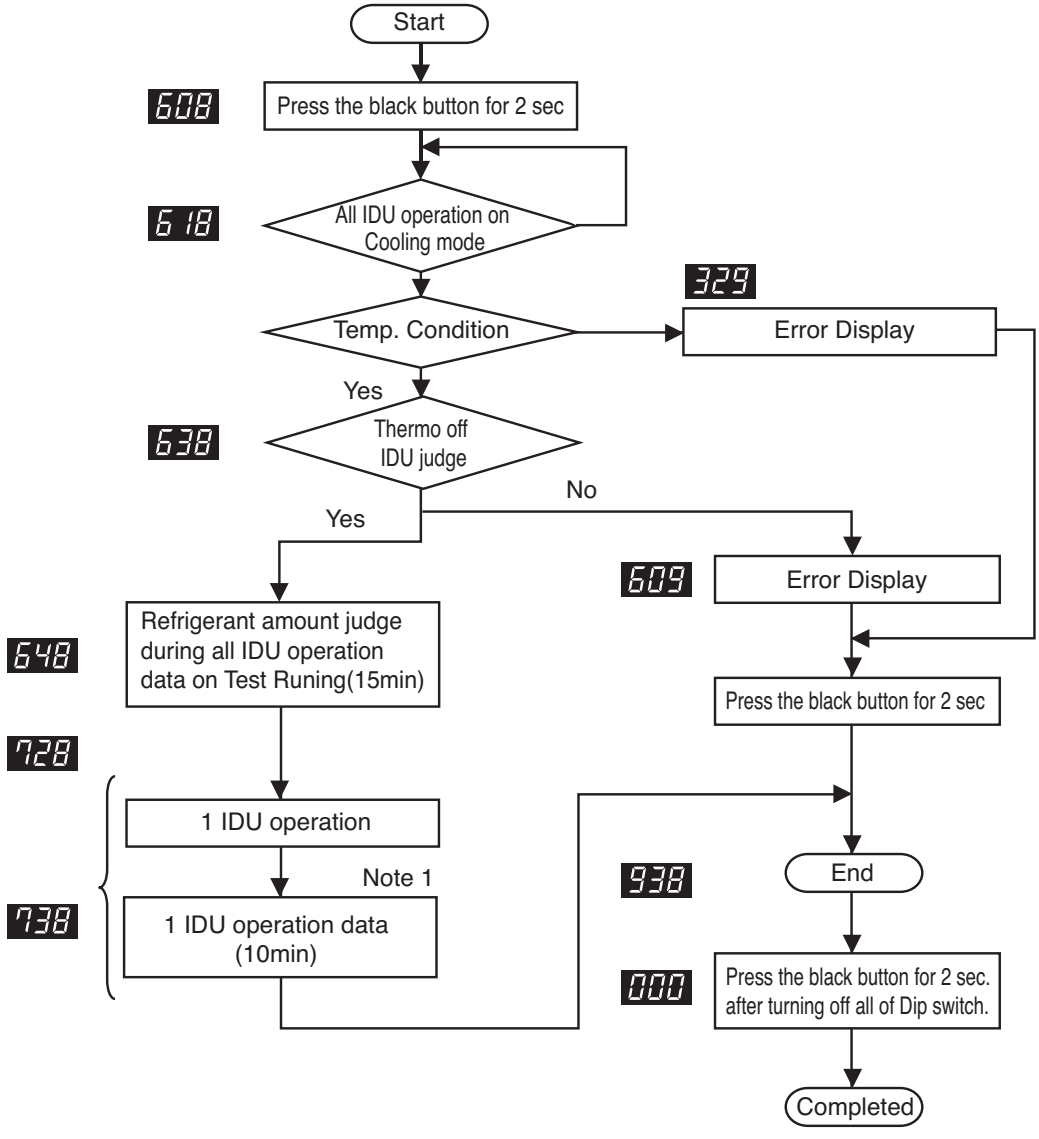
How to Cope with Result of Refrigerant checking

1. If the temperature is not in guaranteed Temperature range, the system will not execute Refrigerant checking and the system will be OFF.
2. **Excess of Refrigerant(619)**
   After remove the 20% of calculated total refrigerant, recharge the refrigerant by using Refrigerant Auto Charging Function.
3. **Scarcity of Refrigerant(629)**
   Charge the refrigerant by using Refrigerant Auto Charging Function.
4. **Impossible to Judge(639)**
   IF the system is not in order, check the other problem except refrigerant.

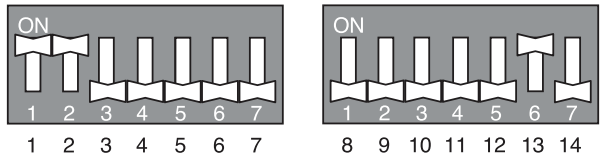
4.6 Integrated Test Runing Function_Cooling Mode (Set 3)

This function is checking process for normal operation of parts and system on operating system.

- All processes carry out included refrigerant amount judge logic and check normal condition of parts on cooling mode.
- This function check only normal condition of parts on heating mode.
- Saved data can check using LGMV.



DIP Switch Settings



Warning : Please reset Main PCB before starting this function

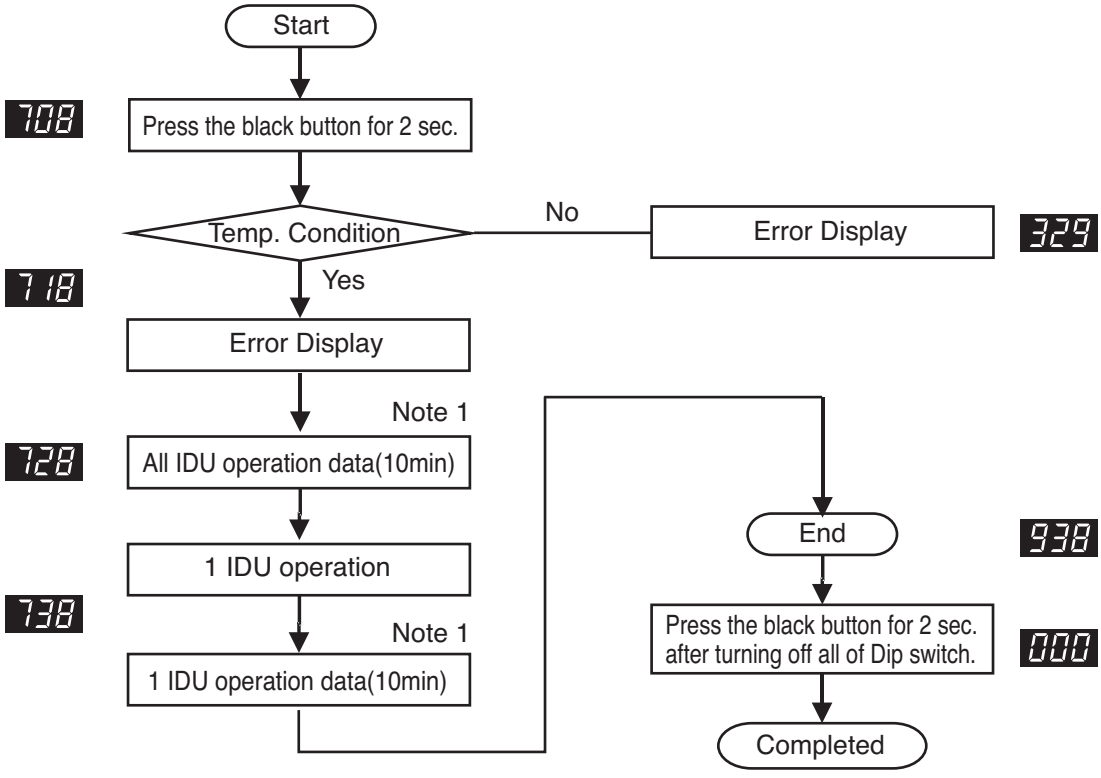
Note

1. Judge the normal condition refer to report of Test Running.

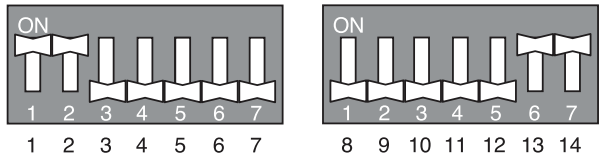
4.7 Integrated Test Runing Function_Heating Mode (Set 4)

The function is checking process for normal operation of parts and system on operationg system.

- All processes carry out included drefrigerant amount judge logic and check normal condition of parts on heating mode.
- This function check only normal condition of parts on heating mode.
- Saved data can check using LGMV.



DIP Switch Settings



Warning : Please reset Main PCB before starting this function

Note

1. Judge the normal condition refer to report of Test Running.

CAUTION

1. **Guaranteed Temperature range(Error occurs out of guaranteed temperature range)**
   IDU : 20 ~ 35 °C
   ODU : 0 ~ 43 °C
2. **Set IDU wired remote controller temperature sensor setting as 'IDU'.**
3. **Make certain that IDU doesn't run with thermo off mode during operation.**

[Error contents about auto refrigerant charging function]

1. 329 : Temperature Range Error (In case that IDU or ODU is out of range)
2. 609 : System Unstable Error (In case, After 45 min operating the system, it does not be stable)

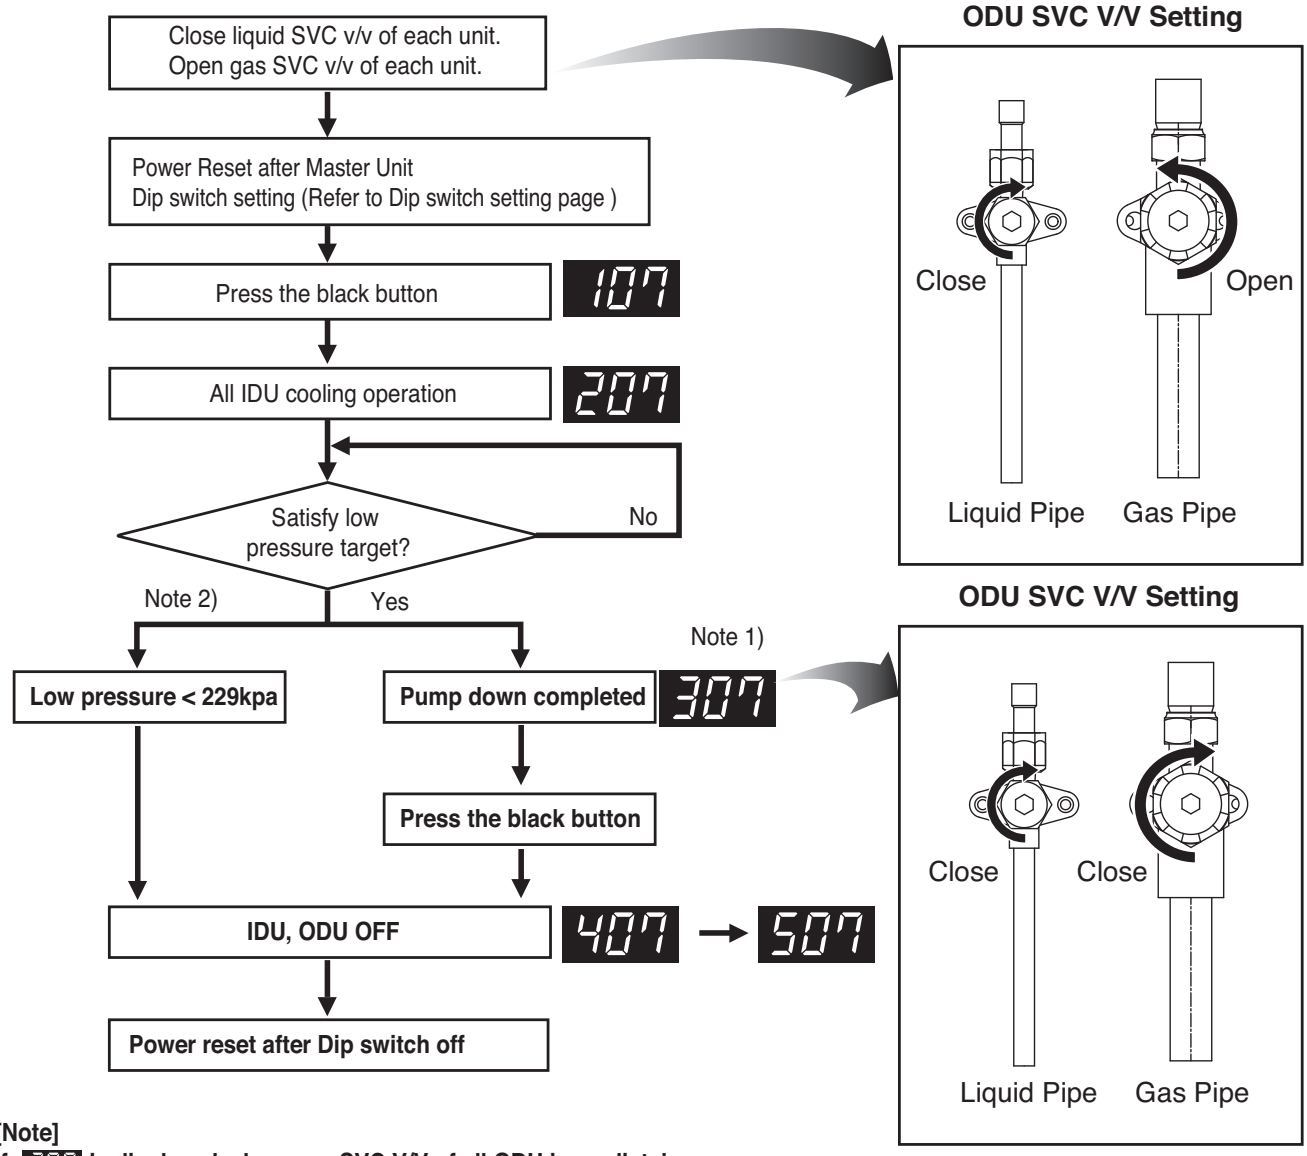
How to Cope with Result of Refrigerant checking

1. If the temperature is not in guaranteed Temperature range, the system will not execute Refrigerant checking and the system will be OFF.
2. **Excess of Refrigerant(619)**
   After remove the 20% of calculated total refrigerant, recharge the refrigerant by using Refrigerant Auto Charging Function.
3. **Scarcity of Refrigerant(629)**
   Charge the refrigerant by using Refrigerant Auto Charging Function.
4. **Impossible to Judge(639)**
   IF the system is not in order, check the other problem except refrigerant.

4.8 Pump Down

This function gathers the refrigerant present in the system to ODU

Use this function to store refrigerant of system in ODU for leakage or IDU replacement.



[Note]

If 307 is displayed, close gas SVC V/V of all ODU immediately.

If low pressure descends below 229 kPa, the system turns off automatically. Close the gas SVC V/V immediately.

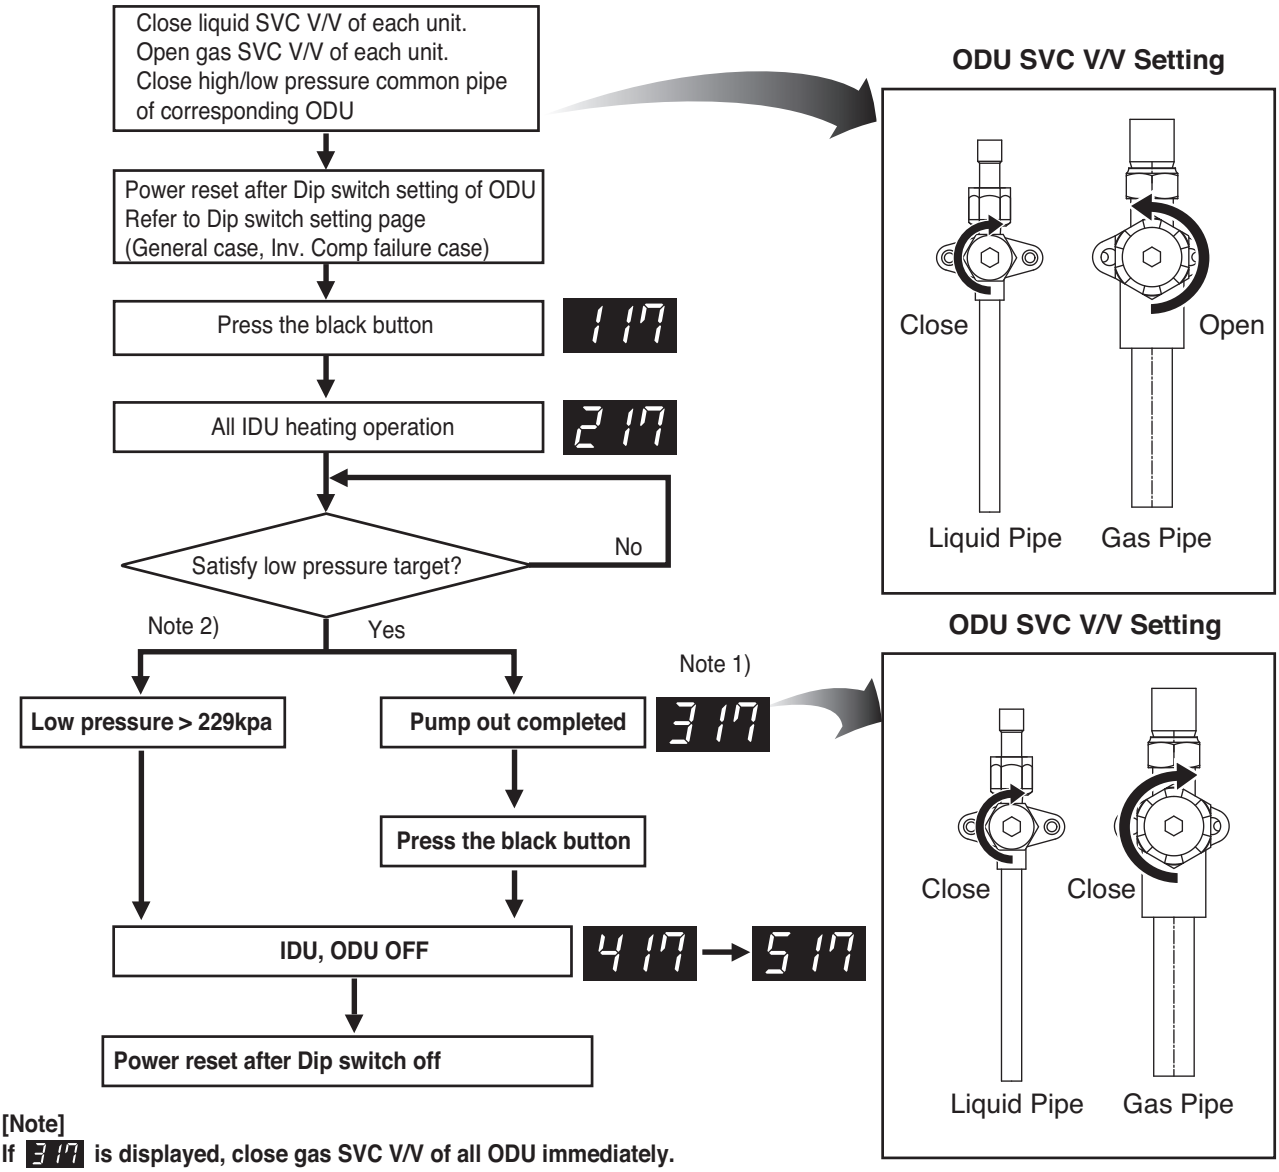
⚠ Caution

1.Use pump down function within guaranteed temperature range
  IDU : 20~32C
  ODU : 5~40C
2. Make certain that IDU doesn't run with thermo off mode during operation
3. Maximum operation time of pump down function is 30 min.
  (in case low pressure doesn't go down)
4. Press black+red button during operation to end pump down.(IDU,ODU off)
  407 → 507

4.9 Pump Out

This function gathers the refrigerant to other ODU and IDU.

Use this function in case of compressor failure, ODU parts defect, leakage.



[Note]

If 3 1 7 is displayed, close gas SVC V/V of all ODU immediately.

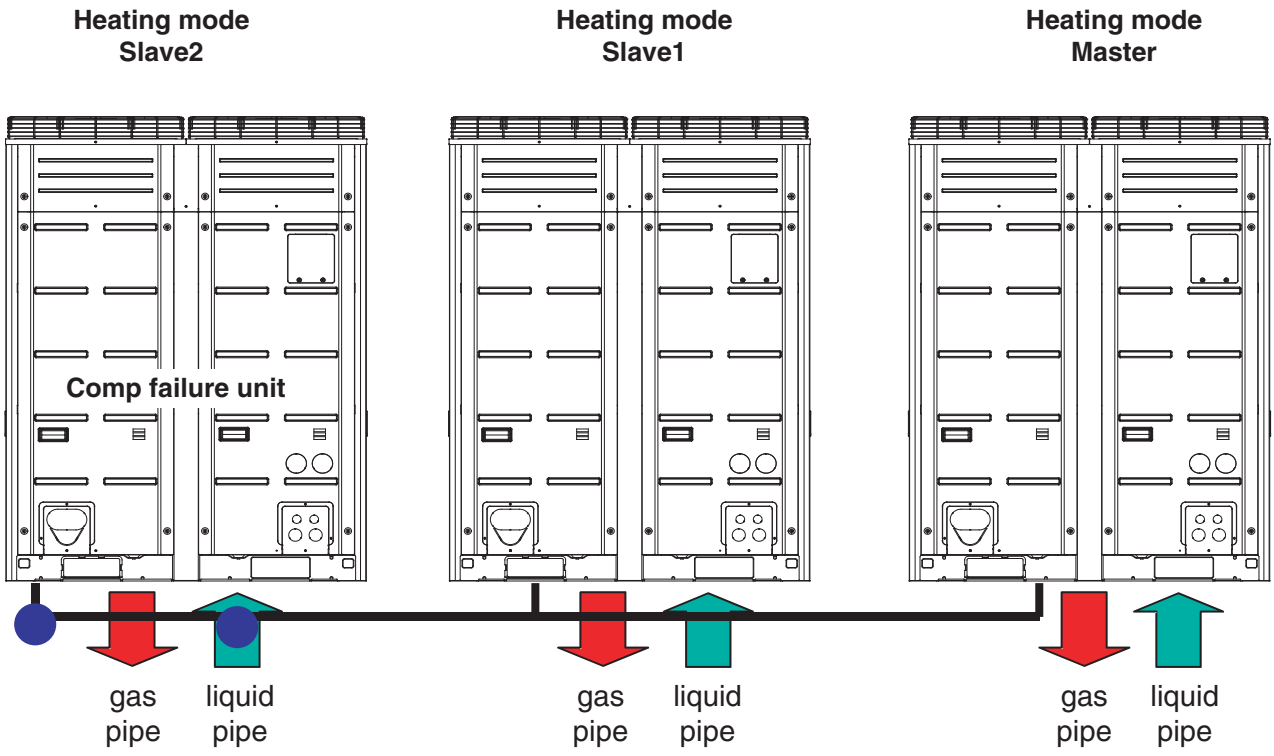
If low pressure descends below 229 kPa, the system turns off automatically. Close gas SVC V/V immediately.

This function is operating only Heat Pump model.

⚠ Caution

1.Use pump out function within guaranteed temperature range
IDU : 10~30°C
ODU : 5~40°C
2. Make certain that IDU doesn't run with thermo off mode during operation
3. Pump out function takes 2~5 min. after compressor start.
Make certain that IDU doesn't run with thermo off mode during operation
(in case low pressure doesn't go down)
4. Press black+red button during operation to end pump out.(IDU,ODU off)
4 1 7 → 5 1 7

■ Example. Slave2 ODU Inv Comp failure

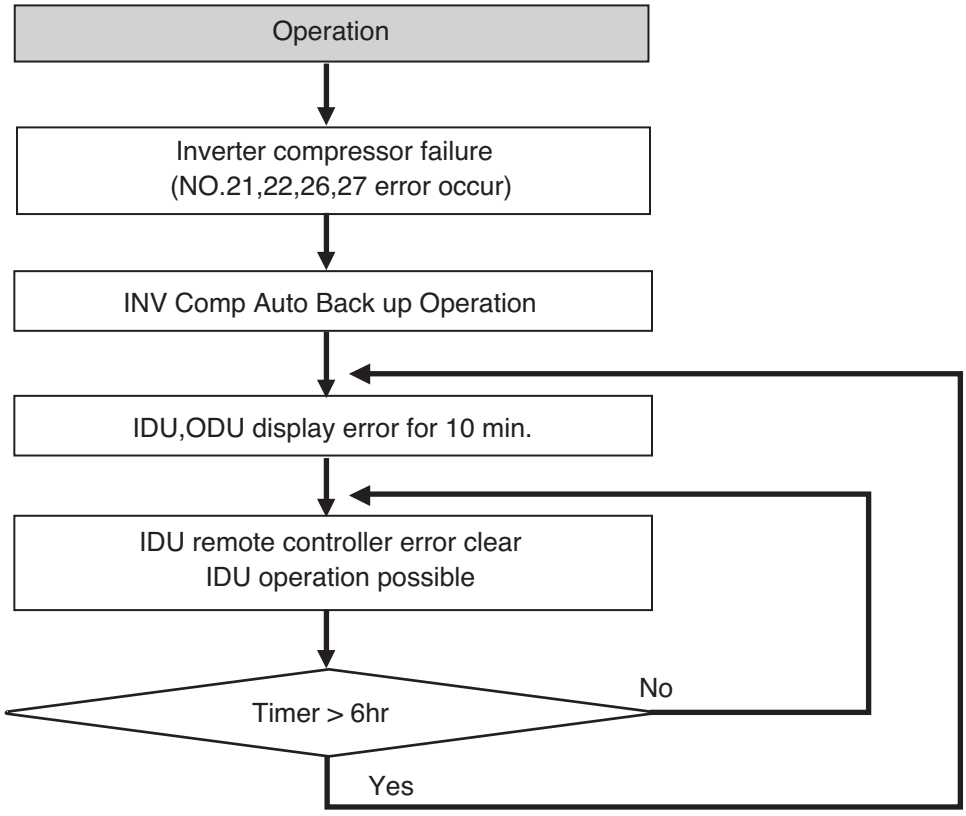


1. Close liquid pipe and common pipe of the unit for pump out operation.
2. Operate pump out
3. Close gas pipe of unit after completion
4. End pump out
5. Close common pipe of no.1,2.
6. Eliminate refrigerant in common pipe after opening the common pipe of corresponding ODU. Replace compressor and perform vacuum.
7. Add the refrigerant with auto charging function

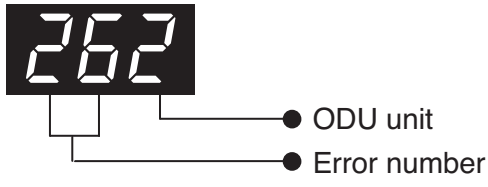
4.10 Auto Back Up Function_Inverter compressor

This function allows the system to operate in case of inverter compressor failure by backing up compressor automatically.

SVC can be asked by displaying error to the customer every 6 hours.



Example) Slave1 Unit INV Comp start failure error occur

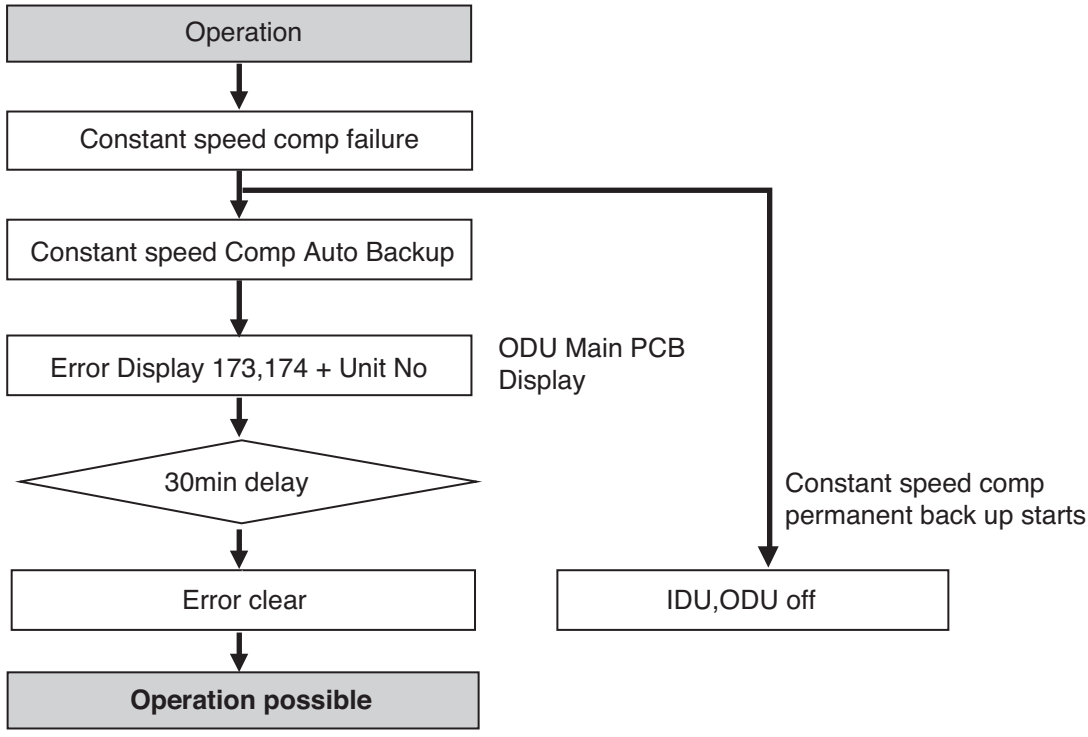


Caution

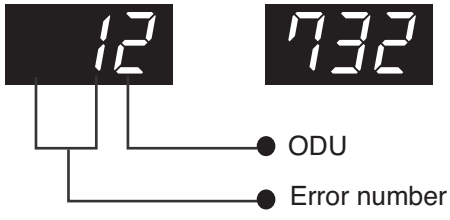
1. Request SVC immediately if error occurs.
2. Auto back up is set up to 1 inverter Comp
3. If Inverter Comp Auto Back up starts, error displays for 10 min. every 6 hours.
4. Error displays continuously at the corresponding ODU.

4.11 Auto Back Up Function_constant speed compressor

This function allows the system to operate in case of constant speed compressor failure by backing up compressor automatically.



Example) Slave1 Unit constant speed Comp failure(No.173)



Caution

1. Request SVC immediately if error occurs

4.12 Night Low Noise Function

In cooling mode, this function makes the ODU fan operate at low RPM to reduce the fan noise of ODU at night which has low cooling load.

Max. RPM setting method

Set the DIP S/W

↓

Reset the power

↓

Setting the Fan Max. RPM Note 1)

↓

Setting Complete

RPM / Time Settings

		Capacity		Judgment Time (hr)	Operation Time (hr)
Capacity(Hp)		8	10~14		
Step		Fan Maximum RPM			
1	①	790	900	8	9
2				6.5	10.5
3				5	12
4	②	680	800	8	9
5				6.5	10.5
6				5	12
7	③	620	780	8	9
8				6.5	10.5
9				5	12

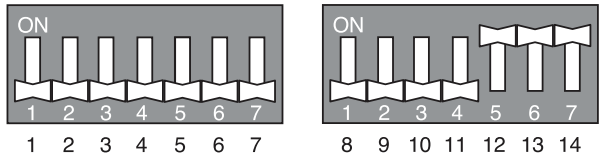
Note 1)
Setting Method for Fan Max. RPM

Step	Black Button	Red Button
1	1 time	1 time
2	2 time	1 time
3	3 time	1 time
4	4 time	1 time
5	5 time	1 time
6	6 time	1 time
7	7 time	1 time
8	8 time	1 time
9	9 time	1 time

Noise

	Capacity	
Capacity(Hp)	8	10~14
Step	Max RPM Noise(dB)	
Standard	58	62
①	55	59
②	52	56
③	49	53

DIP Switch Settings



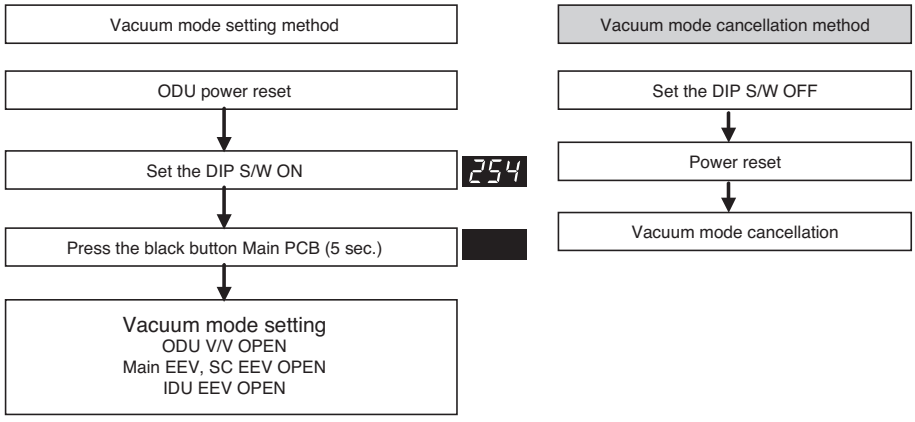
Warning : Please reset Main PCB before starting this function

CAUTION

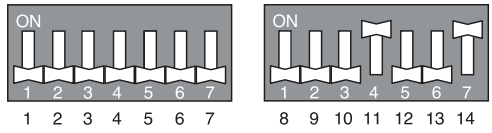
1. Request installer to set the function during installation.
2. In case the function is not used, set the dip S/W OFF and reset the power.
3. If ODU RPM changes, cooling capacity may go down.

4.13 Vacuum Mode

This function is used for creating vacuum in the system after compressor replacement, ODU parts replacement or IDU addition/replacement.



DIP Switch Settings



Warning : Please reset Main PCB before starting this function

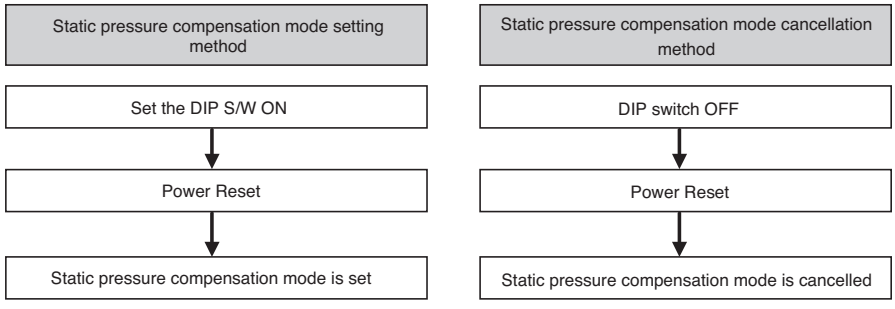
CAUTION

ODU operation stops during vacuum mode.

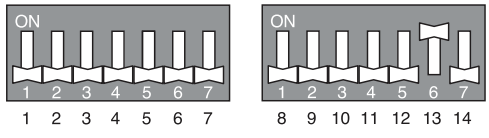
4.14 Static pressure compensation mode

This function is used for creating vacuum in the system after compressor replacement, ODU parts replacement or IDU addition/replacement.

High static pressure mode : Set DIP S/W



DIP Switch Settings



Warning : Please reset Main PCB before starting this function

4.15 Black Box Function

This function saves data immediately before the error occurs in ODU main PCB, and thus making error analysis cause possible.

Data Loading Method

IDU, ODU stop

↓

Press the black button (5 sec.)

↓

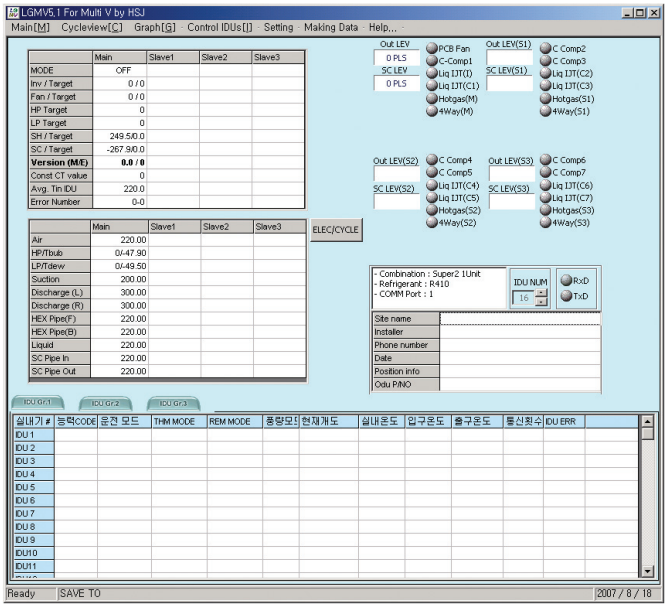
EEPROM ➠ Main Micom data Loading

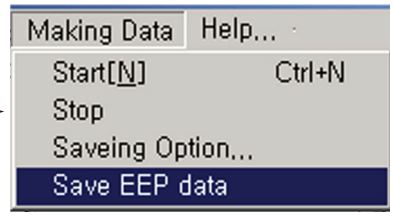
Yellow LED(LED01C) stops when data is loading
After completion, it is starts blinking (about 20 sec.).

↓

EEPROM data save to PC by using
<Save EEP data> in LGMV

■ Saving process : Making Data ➠ Save EEP data ➠ data saving place select ➠ file save





Part 3
PCB Setting and Test Run

Test Run

1. Checks Before Test Run

1	Check to see whether there is any refrigerant leakage, and slack of power or communication cable.
2	Confirm that 500 V megger shows 2.0 MΩ or more between power supply terminal block and ground. Do not operate in the case of 2.0 MΩ or less. NOTE: Never carry out megaohm check over terminal control board. Otherwise the control board would be broken. Immediately after mounting the unit or after leaving it turned off for an extended length of time, the resistance of the insulation between the power supply terminal board and the ground may decrease to approx. 2 MΩ as a result of refrigerant accumulating in the internal compressor. If the insulation resistance is less than 2 MΩ, turning on the main power supply and energizing the crankcase heater for more than 6 hours will cause the refrigerant to evaporate, increasing the insulation resistance.
3	Check if high/low pressure common pipe, liquid pipe and gas pipe valves are fully opened. NOTE: Be sure to tighten caps.
4	Check if there are any problems in automatic addressing Check and confirm that there are no error messages in the display of indoor units or remote controls and LED in outdoor units.

⚠ CAUTION

when cutting main power of the Multi V

- **Always apply main power of the outdoor unit during use of product (cooling season/heating season).**
- **Always apply power before 4 hours to heat the crank case heater where performing test run after installation of product. It may result in burning out of the compressor if not preheating the crank case with the electrical heater for more than 4 hours.(In case of the outdoor temperature below 10°C)**

⚠ CAUTION

Preheat of compressor

- **Start preheat operation for 4 hours after supplying main power.**
- **In case that the outdoor temperature is low, be sure to supply power 4 hours before operation so that the heater is heated(insufficient heating may cause damage of the compressor.)**

2. How to cope with Test Run abnormality

The phenomena from main component failure

Component	Phenomenon	Cause	Check method and Trouble shooting
Compressor	Not operating	Motor insulation broken	Check resistance between terminals and chassis
		Strainer clogged	Change strainer
		Oil leakage	Check oil amount after opening oil port
	Stop during running	Motor insulation failure	Check resistance between terminals and chassis
	Abnormal noise during running	R-S-T misconnection	Check compressor R-S-T connection
Outdoor fan	High pressure error at cooling	Motor failure, bad ventilation around outdoor heat exchanger	Check the outdoor fan operation after being turned the outdoor units off for some time. Remove obstacles around the outdoor units
Outdoor EEV	Heating failure, frequent defrosting	Bad connector contact	Check connector
	No operating sound at applying power	Coil failure	Check resistance between terminals
	Heating failure, frozen outdoor heat exchanger part	EEV clogged	Service necessary
	Low pressure error or discharge temperature error	EEV clogged	Service necessary

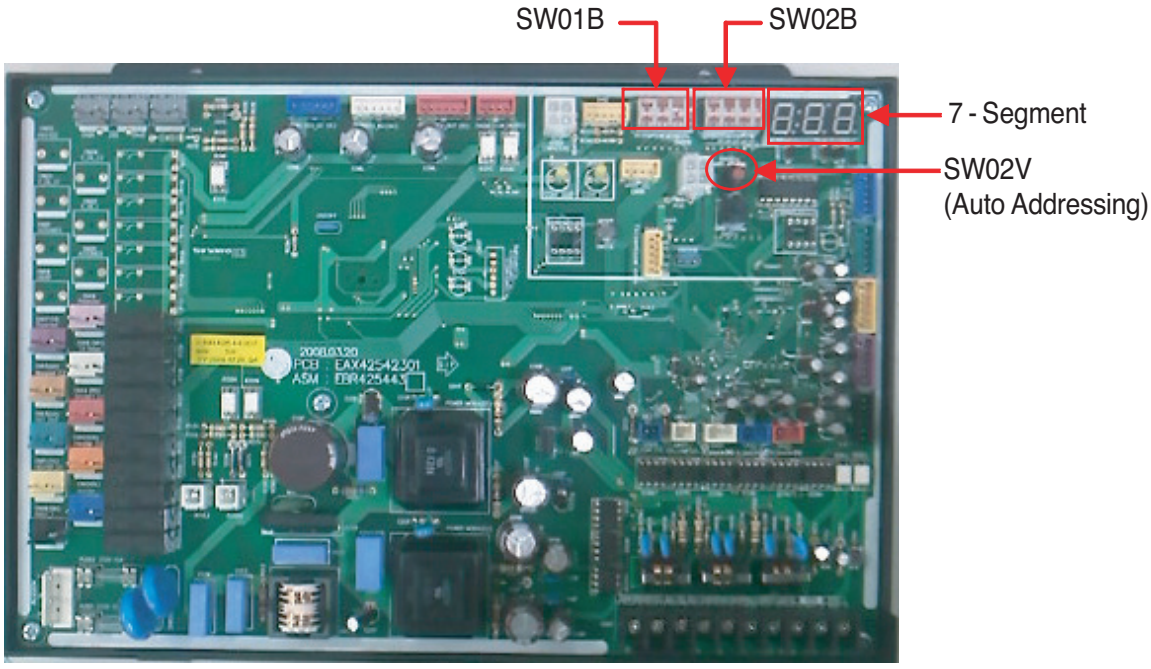
When system fault occurs, the error code is displayed at indoor unit display or remote control display, the trouble shooting guide is in the service manual

- When CH05/53/11 ERROR occurs, check if auto-addressing has done and communication wiring is ok.
- For detailed information, please refer Multi V Troubleshooting Guide Book.

3. DIP Switch Setting

■ Location of setting Switch

Heat Pump (Main PCB)



DIP switch setting

■ Checking according to dip switch setting

You can check the setting values of the master outdoor unit from the 7 segment LED.
Power reset is required every time the DIP switch setting is changed

■ Checking the setting of the Master unit

The number is sequentially appeared at the 7 segment in 5 seconds after applying the power. This number represents the setting condition. (For example, represents R410A 30HP)
Master model code ➔ Slave1 model code ➔ Slave2 model code ➔ total capacity ➔ 2 ➔ 25 ➔ 140

1 ~255 : Master model code
1 ~255 : Slave1 model code
1 ~255 : Slave2 model code
1 ~255 : Slave3 model code
} Refer to table code

8~42HP : HP number(sum of master capacity and slave capacity)
No display : cooling only 2 : heat pump
25 : normal
160 : Model Type (ARUN***DT3)

Example) 28Hp, R410A

15 → 15 → 28 → 2 → 25 → 160

CAUTION

Product may not properly operate if the relevant DIP switch is not properly setup.

Model Code

Model Code	Unit (HP)	Unit	Ref.
12	8	Master & Slave	R410A
13	10		
14	12		
15	14		

■ Setting the DIP switch

Heat pump

• If you set the Dip switch when power is on, the changed setting will not be applied immediately.
The changed setting will be enabled only when Power is reset or by pressing Reset button.

⚠ CAUTION

1. 'X' mark within the table means that the dip switch must be pulled down. If not, the function may not work properly.
2. If the applicable dip switch is not set properly, the product may not work properly.
3. When executing the test operation, check the operating condition of the indoor unit and only execute the operation when all indoor units are stopped.
4. Auto test operation function does not work for the product where only one indoor unit is connected.
5. Cooling Only model is not working on functions of Heat Pump model.

Part 4
Trouble shooting guide

Trouble shooting guide

1. The phenomena from main component failure

The phenomena from main component failure

Component	Phenomenon	Cause	Check method and Trouble shooting
Compressor	Not operating	Motor insulation broken	Check resistance between terminals and chassis
		Strainer clogged	Change strainer
		Oil leakage	Check oil amount after opening oil port
	Stop during running	Motor insulation failure	Check resistance between terminals and chassis
	Abnormal noise during running	U-V-W misconnection	Check compressor U-V-W connection
Outdoor fan	High pressure error in cooling mode operation	Motor failure, bad ventilation around outdoor heat exchanger	Check the fan operation to confirm proper motor functioning. Switch OFF the outdoor unit and remove obstacles, if any, around the HEX. Check connector
Outdoor EEV	Heating failure, frequent defrosting	Bad connector contact	Check resistance between terminals
	No operation sound after switching ON the power supply	Coil failure	Service necessary
	Heating failure, frozen outdoor heat exchanger part	EEV clogged	Service necessary
	Low pressure error or discharge temperature error	EEV clogged	

When system fault occurs, the error code is displayed on the indoor unit display or remote control display. The trouble shooting guide is available in the service manual.

• When CH05/53/11 ERROR occurs, check if auto-addressing has done and communication wiring is ok.

2. Checking Method for Key Components

2.1 Compressor

Check and ensure in following order when error related with the compressor or error related with power occurs during operation:

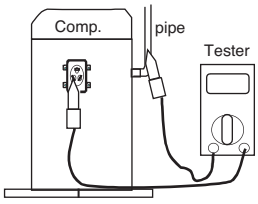
<table>
<tr><th>No.</th><th>Checking Item</th><th>Symptom</th><th>Countermeasure</th></tr>
<tr><td rowspan="2">1</td><td rowspan="2">Is how long power on during operation?</td><td>1) Power on for 12 hours or more</td><td>* Go to No.2.</td></tr>
<tr><td>2) Power on for 12 hours or less</td><td>* Go to No.2 after applying power for designated time (12 hours).</td></tr>
<tr><td rowspan="3">2</td><td>Does failure appears again when starting operation?</td><td>1) The compressor stops and same error appears again.</td><td>* Check IPM may fail.</td></tr>
<tr><td>Method to measure insulation resistance
 


Figure 1.
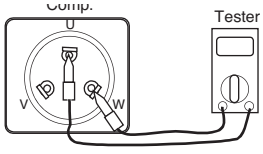
Method to measure coil resistance
 


Figure 2.</td><td>2) If output voltage of the inverter is stably output. *1</td><td>* Check coil resistor and insulation resistor. If normal, restart the unit. If same symptom occurs, replace the compressor.
* Insulation resistor: 2MW or more
Coil resistor:
<table><tr><th></th><th>Inveter</th><th>Constant speed</th><th>Checking Temperature</th></tr><tr><td>U-V</td><td>0.438% ± 7%</td><td>2.19% ± 7%</td><td>25°C</td></tr><tr><td>U-W</td><td>0.433% ± 7%</td><td>2.13% ± 7%</td><td>25°C</td></tr><tr><td>W-U</td><td>0.435% ± 7%</td><td>2.26% ± 7%</td><td>25°C</td></tr></table></td></tr>
<tr><td>3) If output voltage of the inverter is unstable or it is 0V.
(When incapable of using a digital tester)</td><td>* Check the IPM.
If the IPM is normal, replace the inverter board.
* Check coil resistor and insulation resistor.</td></tr>
</table>

[Cautions when measuring voltage and current of inverter power circuit]

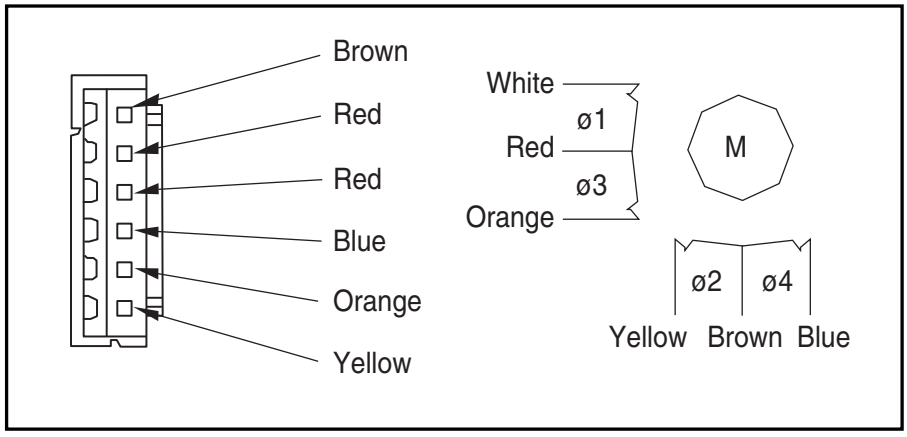
Measuring values may differ depending on measuring tools and measuring circuits since voltage, current in the power supply or output side of the inverter has no since waveform.
Especially, output voltage changes when output voltage of the inverter has a pattern of pulse wave.
In addition, measuring values appear largely differently depending on measuring tools.

1) If using a movable tester when checking that output voltage of the inverter is constant (when comparing relative voltage between lines), always use an analog tester. Especially exercise particular caution if the output frequency of the inverter is low, when using a movable tester, where change of measured voltage values is large between other lines, when virtually same values appear actually or where there is danger to determine that failure of the inverter occurred.
2) You can use rectification voltmeter (⊣▶⊢) if using commercial frequency tester when measuring output values of the inverter (when measuring absolute values). Accurate measuring values cannot be obtained with a general movable tester (For analog and digital mode).

2.2 Fan Motor

Checking Item	Symptom	Countermeasure
(1) The fan motor does not operate. Does failure appears again when starting operation? (2) Vibration of the fan motor is large.	1) When power supply is abnormal	* Modify connection status in front of or at the rear of the breaker, or if the power terminal console is at frosting condition.
		* Modify the power supply voltage is beyond specified scope.
	2) For wrong wiring	* For following wiring. 1. Check connection status. 2. Check contact of the connector. 3. Check that parts are firmly secured by tightening screws. 4. Check connection of polarity. 5. Check short circuit and grounding.
	3) For failure of motor	* Measure winding resistance of the motor coils. - Panasonic Motor : 9.5 Ω ± 5% (@25˚C) - LG Motor : 8.6 Ω ± 7% (@25˚C)
	4) For defective fuse 5) For failure of circuit board	* Replace the fuse if there is defect (Fuse 800V 30A). Replace the circuit board in following procedures if problems occur again when powering on and if there are no matters equivalent to items as specified in above 1) through 4). (Carefully check both connector and grounding wires when replacing the circuit board.) 1. Replace only fan control boards. If starting is done, it means that the fan control board has defect. 2. Replace both fan control board and the main board. If starting is done, it means that the main board has defect. 3. If problems continue to occur even after countermeasure of No.1 and No.2, it means that both boards has defect.

2.3 Electronic Expansion Valve



• Pulse signal output value and valve operation

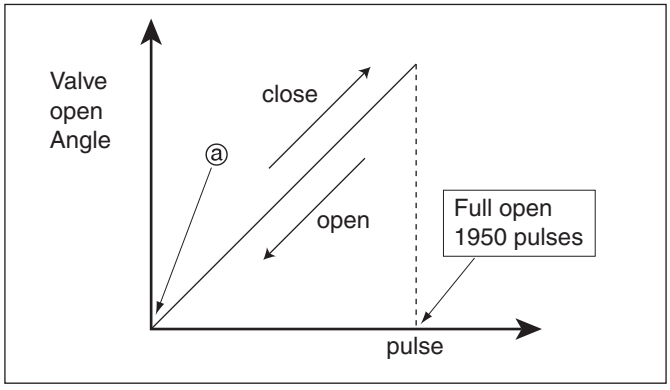
Output(ø) No.	Output state			
	1	2	3	4
ø1	ON	ON	OFF	OFF
ø2	ON	ON	ON	ON
ø3	OFF	OFF	OFF	ON
ø4	OFF	OFF	OFF	OFF

• Output pulse sequence

- In valve close state: 4 → 3 → 2 → 1 → 4
- In valve open state: 1 → 2 → 3 → 4 → 1

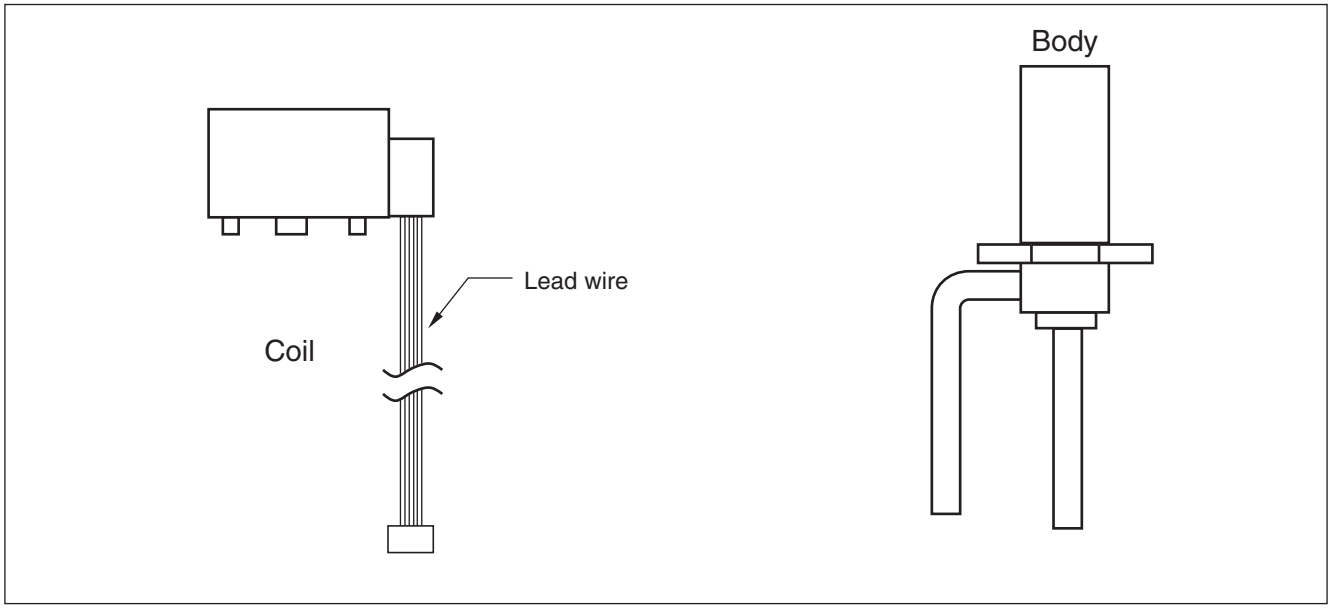
* 1. If EEV open angle does not change, all of output phase will be OFF
2. If output phase is different or continuously in the ON state, motor will not operate smoothly and start vibrating.

• EEV valve operation

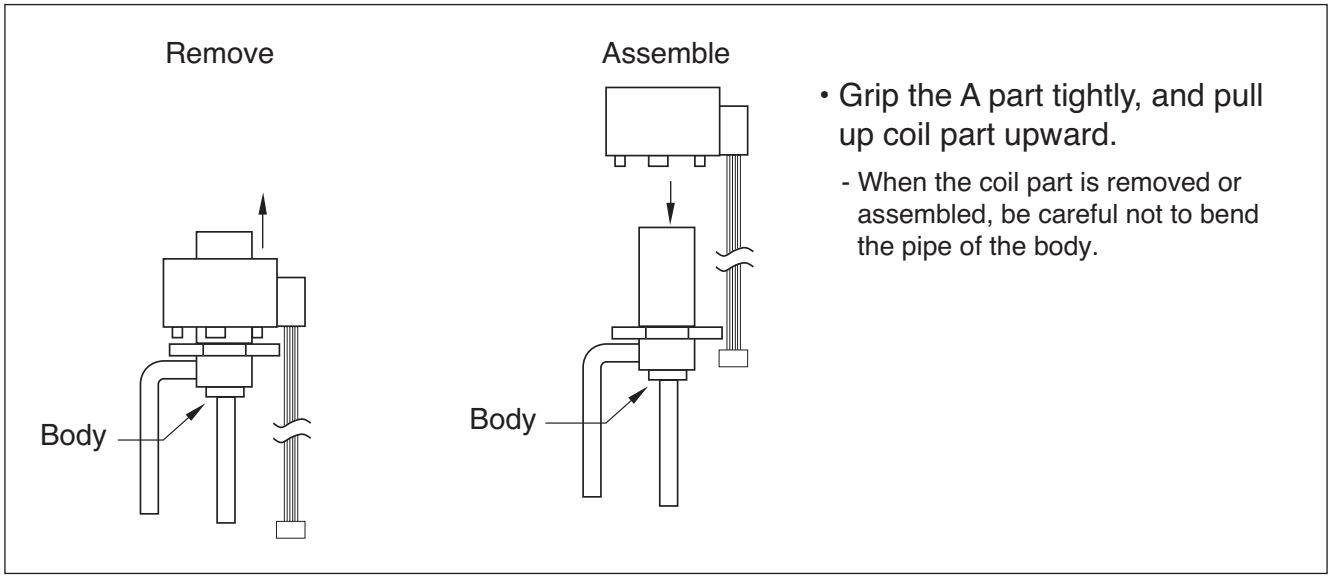


- At power ON, open angle signal of 1400 pulses output and valve position is set to ⓐ
  If valve operates smoothly, no noise and vibration occurs and if valve is closed. noise occurs.
- Noise from EEV can be confirmed by touching the EEV surface with a screw driver and listening the EEV noise.
- If liquid refrigerant is in EEV, the noise is lower.

• **EEV Coil and body(Outdoor unit)**



• **Remove and assemble the coil**

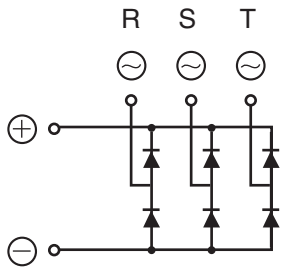


- **EEV failure check method**

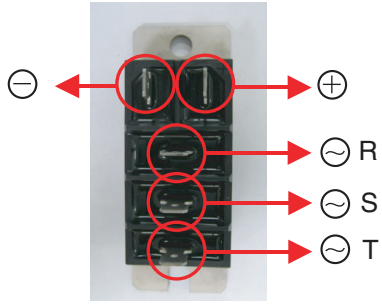
Failure mode	Diagnosis	Repair process	Unit
Microcomputer Driving circuit failure	1.Disconnect the EEV connector form control board and connect testing LED  2. Main power ON, pulse signal is out from EEV for 17 sec. If LEDs do not turn on, or are in on state continuously, then driving circuit is abnormal	Check and replace Indoor unit control board	Indoor unit
EEV locking	1.If EEV is locked, in no load state, the driving motor rotate, and clicking sound always occurs	Replace EEV	Indoor / Outdoor unit
EEV Motor coil short or misconnection	1. Check the resistance between coil terminal (red-white, red-yellow, red-orange, red-blue) 2. If the estimated resistance value is in 52 ± 3Ω then the EEV is normal	Replace EEV	Outdoor unit
	1. Check the resistance between coil terminal (brown-white, brown-yellow, brown-orange, brown-blue) 2. If the estimated resistance value is in 150 ± 10Ω then the EEV is normal	Replace EEV	Indoor unit
Full closing (valve leakage)	1. Operate indoor unit with FAN mode and operate another indoor unit with COOLING mode 2. Check indoor unit(FAN mode) liquid pipe temperature (from operation monitor of outdoor unit control board) 3. When fan rotate and EEV is fully closed, if there is any leakage, then the temperature is down If estimated temperature is very low in comparison with suction temperature which is displayed at remote controller then the valve is not fully closed	If the amount of leakage is much, Replace EEV	Indoor unit

2.4 Phase Bridge Diode Checking Method

Internal circuit diagram



Appearance



1. Wait until inverter PCB DC voltage gets discharged, after the main power switch off.
2. Pull out all the connectors connected with 3 phase bridge diode.
3. Set multi tester in diode mode.
4. Measured value should be 0.4~0.7V measuring as below table.
5. In case the measured value is different from the table, set multi tester to resistance mode and measure. If the value is small (0 Ω) or high (hundreds M Ω), PCB needs to be replaced.
6. In case that bridge diode is damaged, check if inverter PCB assembly(IPM) is needed to be replaced.

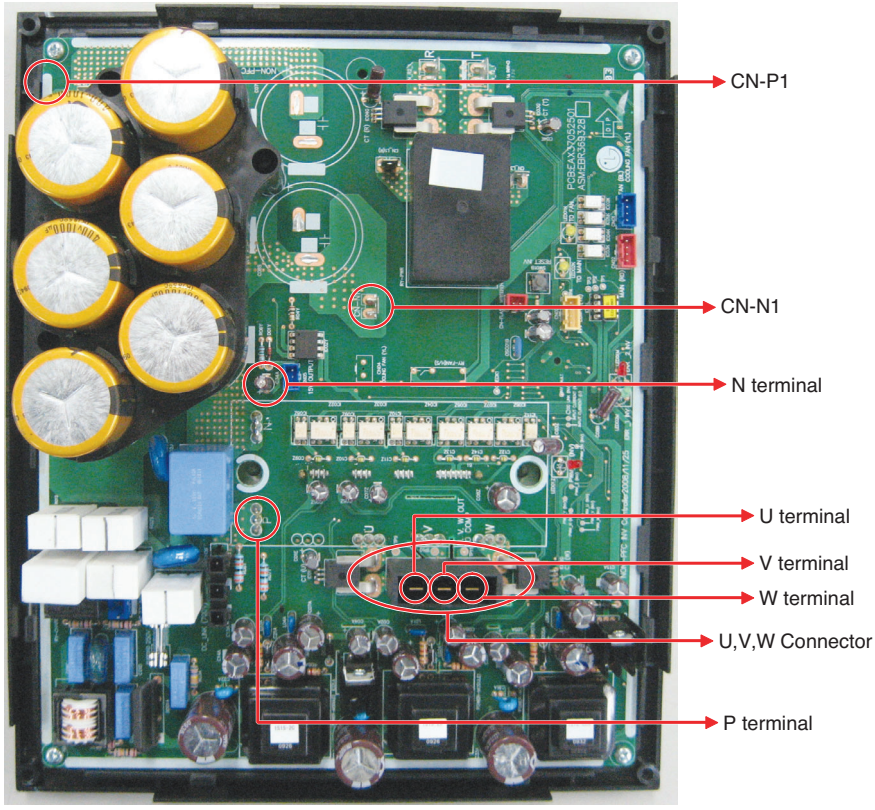
Diode terminal / Tester terminal	+ terminal: black(-)	- terminal: red(+)
R(~) : red(+)	0.4 V ~ 0.7 V	-
S(~) : red(+)	0.4 V ~ 0.7 V	-
T(~) : red(+)	0.4 V ~ 0.7 V	-
R(~) : black(-)	-	0.4 V ~ 0.7 V
S(~) : black(-)	-	0.4 V ~ 0.7 V
T(~) : black(-)	-	0.4 V ~ 0.7 V

✻ Red(+) and black(-) are the measuring terminals of multi tester.

CAUTION

- **Check the electric parts of c/box, 10 minutes after switching off the main supply and checking DC voltage is discharged. Otherwise, there is chance of getting electric shock.**
- **There is chance of electric shock by charged voltage.**

2.5 Inverter IPM Checking Method



1. Wait until inverter PCB DC voltage is discharged after main power off.
2. Pull out CN-P1, CN-N1 connectors and U,V,W COMP connector connected with the inverter PCB.
3. Set multi tester to resistance mode.
4. If the value between P and N terminal of IPM is short(0Ω) or open(hundreds MΩ), PCB needs to be replaced.(IPM damaged)
5. In the measured value with resistance mode should be within 28K Ω ±10%.
6. In case measured value is different from the table, PCB needs to be replaced.(PCB damaged).

	P terminal : black (-)	**N terminal : red (-)**
U terminal : red(+)	28K Ω ± 10%	Open
V terminal : red(+)	28K Ω ± 10%	Open
W terminal : red(+)	28K Ω ± 10%	Open
	P terminal : red(+)	**N terminal : red (+)**
U terminal : black(-)	Open	28K Ω ± 10%
V terminal : black(-)	Open	28K Ω ± 10%
W terminal : black(-)	Open	28K Ω ± 10%

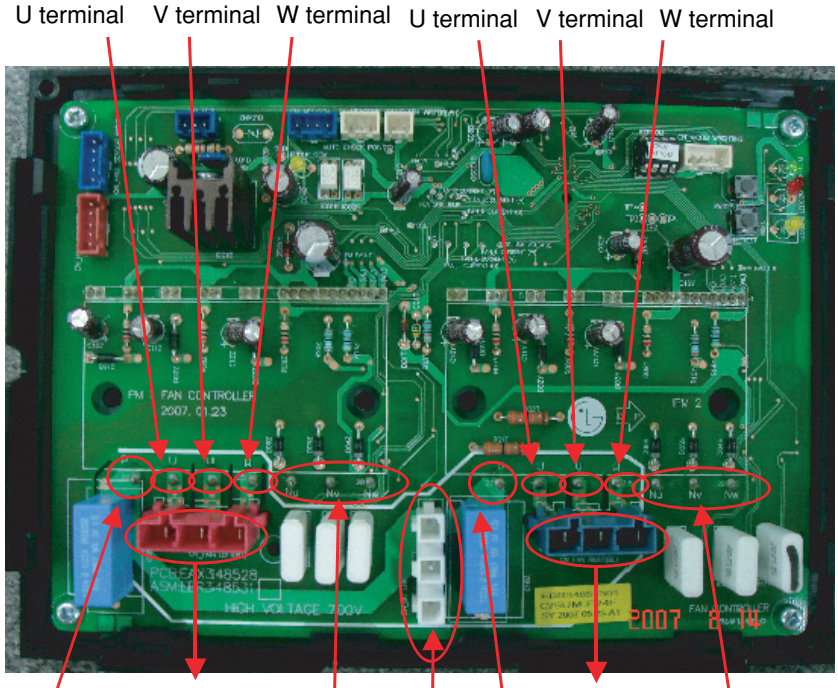
✻ Red(+) and black(-) are the measuring terminals of multi tester.

2.6 Fan IPM Checking Method

1. Wait until inverter PCB DC voltage gets discharged after the main power switch off.
2. Pull out DC connector and U,V,W fan motor connector connected with fan PCB
3. Set multi tester in resistance mode .
4. If the value between P and N terminal of IPM is small (0Ω) or tens KΩ, PCB needs to be replaced (IPM damaged).
5. In case the measured value is open(hundreds KΩ), measure resistance mode, and the value should be within 35 KΩ ±10% as shown below table.
6. If the measured value is different from the value given in the table, PCB is needs to be replaced.

	P terminal : black (-)	**N terminal : red (-)**
U terminal : red(+)	35K Ω ± 10%	Open
V terminal : red(+)	35K Ω ± 10%	Open
W terminal : red(+)	35K Ω ± 10%	Open
	P terminal : red(+)	**N terminal : red (+)**
U terminal : black(-)	Open	35K Ω ± 10%
V terminal : black(-)	Open	35K Ω ± 10%
W terminal : black(-)	Open	35K Ω ± 10%

✻ Red(+) and black(-) are the measuring terminals of multi tester.



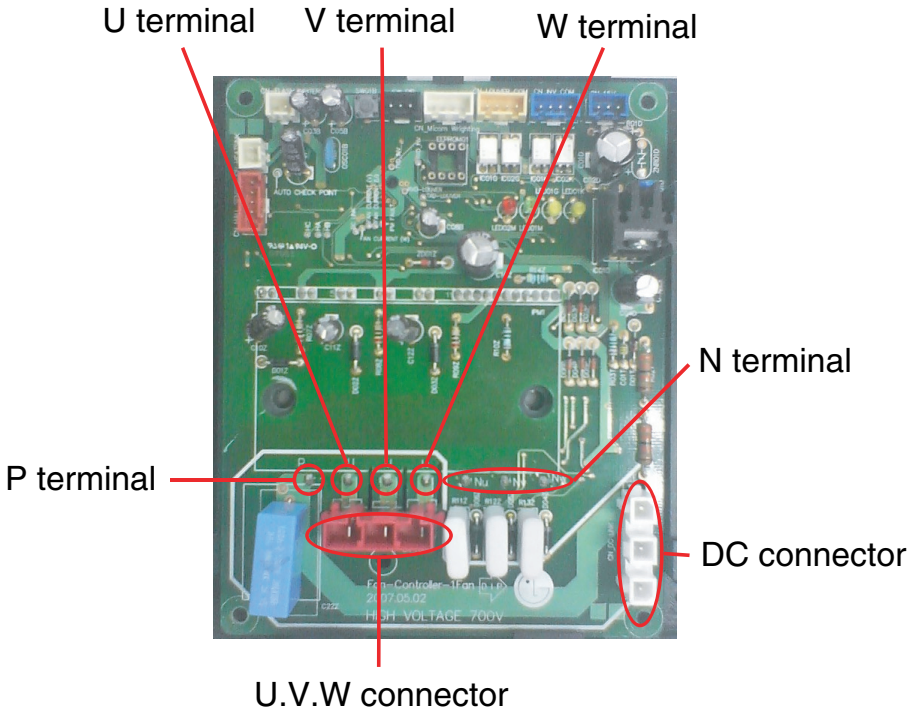
UX3 Fan PCB

2.7 Fan IPM Checking Method

1. Wait until inverter PCB DC voltage gets discharged after the main power switch off.
2. Pull out DC connector and U,V,W fan motor connector connected with fan PCB
3. Set multi tester in resistance mode .
4. If the value between P and N terminal of IPM is small (0Ω) or tens KΩ, PCB needs to be replaced (IPM damaged).
5. In case the measured value is open(hundreds KΩ), measure resistance mode, and the value should be within 35 KΩ ±10% as shown below table.
6. If the measured value is different from the value given in the table, PCB is needs to be replaced.

	P terminal : black (-)	**N terminal : red (-)**
U terminal : red(+)	35K Ω ± 10%	Open
V terminal : red(+)	35K Ω ± 10%	Open
W terminal : red(+)	35K Ω ± 10%	Open
	P terminal : red(+)	**N terminal : red (+)**
U terminal : black(-)	Open	35K Ω ± 10%
V terminal : black(-)	Open	35K Ω ± 10%
W terminal : black(-)	Open	35K Ω ± 10%

✻ Red(+) and black(-) are the measuring terminals of multi tester.



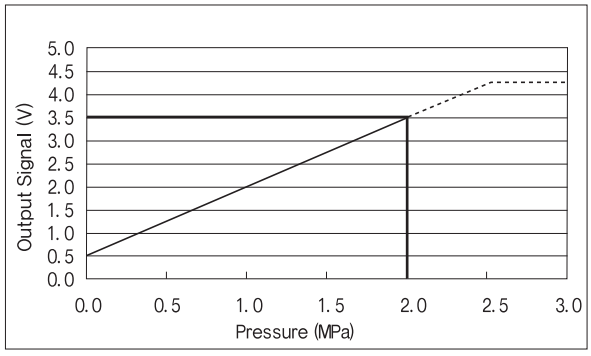
UX2 Fan PCB

2.8 Pressure Sensor(High/Low Pressure Sensor)

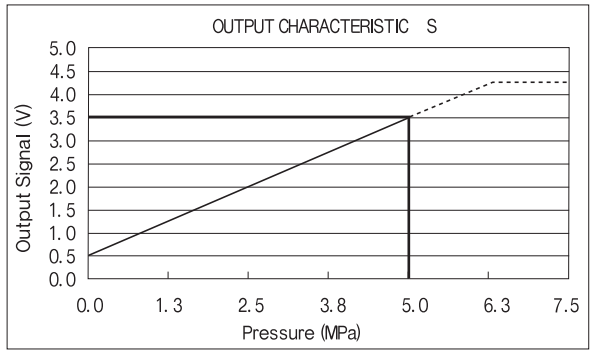
Connect manifold gauge to the service valve of outdoor unit, and compare the output of high pressure sensor to the output of low pressure sensor to detect the defect.

below) Compare the output of pressure sensor to the output of manifold gauge pressure using the table below. Read the pressure clearly between black and white as the composition of pressure sensor.

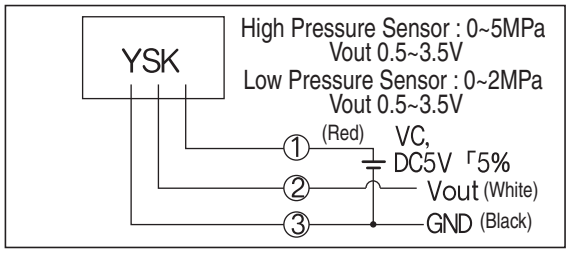
<Low Pressure Sensor>



<High Pressure Sensor>



1) If the pressure of manifold gauge is 0~1kg/cm², it indicates the pressure got lower due to the leakage of refrigerant. Find the place of leakage and fix it.
2) If the difference of the outputs of high and low pressure is in the range of 1kg/cm², the pressure sensor is normal.
3) If the difference of the outputs of high and low pressure is over 1kg/cm², the pressure sensor is out of order, it need to be replaced.
4) The composition of pressure sensor



The pressure sensor is composed like the circuit picture shown above. If DC 5V voltage flows on red and black wire, voltage would be made between the white and black wire. The pressure which is equivalent to the pressure output is shown in the table above.

2.9 Outdoor Fan

1) The outdoor fan is controlled by the inverter motor which can control the number of rotations.
2) The outdoor fan is controlled by the high/low pressure of the outdoor unit after the operation of compressor.
3) There is possibility that the outdoor fan does not operate due to low capacity operation or low outdoor temperature even if the compressor is operating. This does not mean breakdown of the unit, the fan will start operating if it reaches the set point.

2.10 Solenoid Valve

Check the conformity of the operation of solenoid valve to the output sigh of control board.

1) Hot gas bypass valve

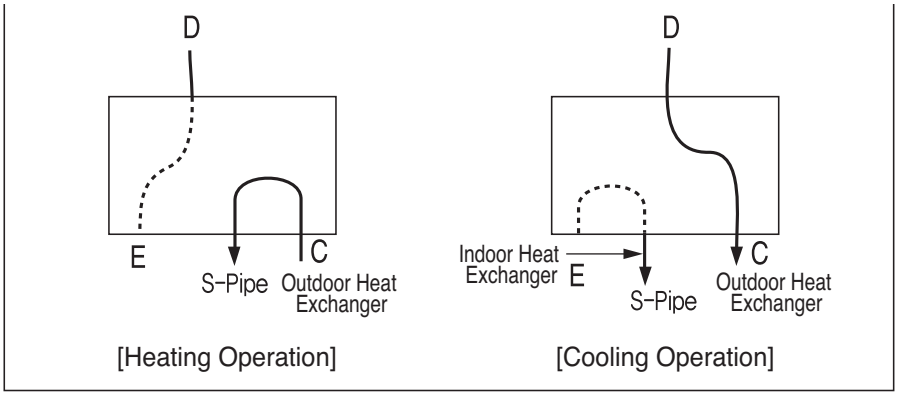
1. When the compressor starts operating, hot gas valve will be on for 1 minute. Check if there is operation noise or piping vibration on the solenoid valve.
2. To get rid of the difference of high and low pressure of system after stop operating the compressor, turn the valve on after 5 seconds.
3. Turn the hot gas valve on if the temperature of compressor suction pipe is lower than ranged temperature.
4. Hot gas valve can be kept on by the condition of cycle operation, this does not indicate the breakdown of the unit.
5. The change of the operation condition by the operation of solenoid valve can be checked by the before and behind temperature of bypass piping and the sound of refrigerant.
6. Insulation resistance in the state of connecting the valve to coil should be over 100mΩ when measure it with DC mega tester(DC 500V).

2) Oil solenoid valve

1. It is located in the bottom of accumulator, and it starts operating after some period of time of the compressor operation to provide oil stored in the bottom of the accumulator to the compressor.
2. When the compressor starts operating, oil solenoid valve will be on for 2 minutes. Check if there is operation noise or piping vibration on the solenoid valve.
3. It turns on right after the compressor stop operating.
4. Solenoid valve can turn on and off repeatedly by the condition of cycle operation; this does not indicate the breakdown of the unit.
5. Insulation resistance in the state of connecting the valve to coil should be over 100mΩ when measure it with DC mega tester(DC 500V).

2.11 4way Valve

1. Keep it off before the outdoor unit is powered on and the indoor unit is turned on.
2. Cooling, defrosting, oil recovery : OFF, heating : ON
3. When alternating cooling to heating, transform 4 way valve during re-starting for 3 minutes.
4. To check the mode of cooling/heating operation of 4 way valve, touch the piping surface of low pressure service valve.
5. Refrigerant flowchart of 4 way valve



6. Insulation resistance in the state of connecting the valve to coil should be over 100mΩ when measure it with DC mega tester(DC 500V).

2.12 Temperature Sensor

1) outdoor temperature sensor : TH1
2) Suction pipe(S-pipe) temperature sensor : TH2
3) Discharge pipe(D-pipe) temperature sensor : TH3
4) Outdoor heat exchanger (center of condenser) temperature sensor :TH2
   1. Check the condition of installation and the contact of temperature sensor.
   2. Check whether the connector contact of temperature sensor is normal.
   3. Measure the resistance of temperature sensor.

	TH1	TH2	TH3
Resistance	10KΩ±1%(@25°C)	5KΩ±1%(@25°C)	200KΩ±1%(@25°C)
	1.07KΩ±3.3%(@85°C)	535Ω±3.3%(@85°C)	28KΩ±7.7%(@85°C)

2.13 Others

Electrolytic capacitor and resistor for voltage distribution

1) Disconnect an terminal of voltage distribution resistor from each DC link electrolytic capacitor
2) Set the multi meter to resistance mode, connect the probe to +,- terminal of the capacitor. If the estimated resistance value is increase continuously without short(value is 0), then the resistor is normal
3) Set the multi meter to resistance mode, confirm that the resistance value of the resistor is around 270 kOhm

Check and replace inferior components

3. Self-diagnosis function

Self-Diagnosis Function

Error Indicator

- This function indicates types of failure in self-diagnosis and occurrence of failure for air condition.
- Error mark is displayed on display window of indoor units and wired remote controller, and 7-segment LED of outdoor unit control board as shown in the table.
- If more than two troubles occur simultaneously, lower number of error code is first displayed.
- After error occurrence, if error is released, error LED is also released simultaneously.

Error Display

1st,2nd LED of 7-segment indicates error number, 3rd LED indicates unit number.

Ex) 211 : No.21 error of master unit 213 : No.21 error of slave2 011 → 051 : No.105 error of master unit

❉ Refer to the DX-Venitilation manual for DX-Venitilation error code

Display				Title	Cause of Error
Indoor unit related error	0	1	-	Air temperature sensor of indoor unit	Air temperature sensor of indoor unit is open or short
	0	2	-	Inlet pipe temperature sensor of indoor unit	Inlet pipe temperature sensor of indoor unit is open or short
	0	3	-	Communication error : wired remote controller ↔ indoor unit	Failing to receive wired remote controller signal in indoor unit PCB
	0	4	-	Drain pump	Malfunction of drain pump
	0	5	-	Communication error : outdoor unit ↔ indoor unit	Failing to receive outdoor unit signal in indoor unit PCB
	0	6	-	Outlet pipe temperature sensor of indoor unit	Outlet pipe temperature sensor of indoor unit is open or short
	0	9	-	Indoor EEPROM Error	In case when the serial number marked on EEPROM of Indoor unit is 0 or FFFFFF
	1	0	-	Poor fan motor operation	Disconnecting the fan motor connector/Failure of indoor fan motor lock
	1	7	-	Inlet Air temperature sensor of FAU	Air temperature sensor of indoor unit is open or short

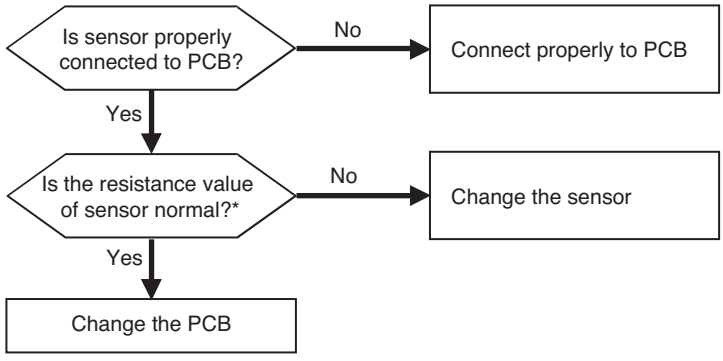
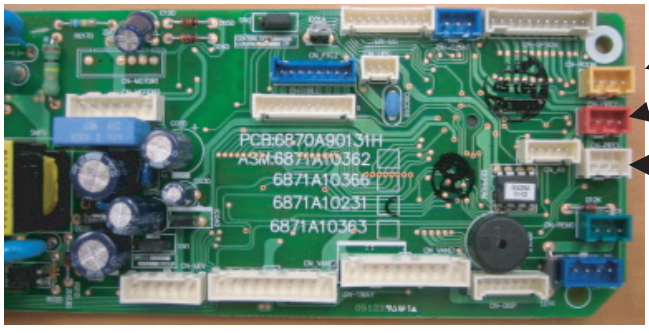
Error No.	Error Type	Error Point	Main Reasons
01	Indoor unit air sensor error	Indoor unit sensor is open/short	1. Indoor unit PCB wrong connection 2. Indoor unit PCB failure 3. Sensor problem (main reason)
02	Indoor unit pipe inlet sensor error		
06	Indoor unit pipe outlet sensor error		
17	Inlet Air temperature sensor error of FAU		

■ Error diagnosis and countermeasure flow chart



** In case the value is more than 100kΩ (open) or less than 100Ω (short), Error occurs

Refer: Resistance value maybe change according to temperature of temp sensor,
It shows according to criteria of current temperature(±5% margin) ➔ Normal
Air temp sensor: 10°C = 20.7kΩ : 25°C= 10kΩ : 50°C= 3.4kΩ
Pipe temp sensor: 10°C = 10kΩ : 25°C= 5kΩ : 50°C= 1.8kΩ



CN-ROOM : Indoor air temp sensor

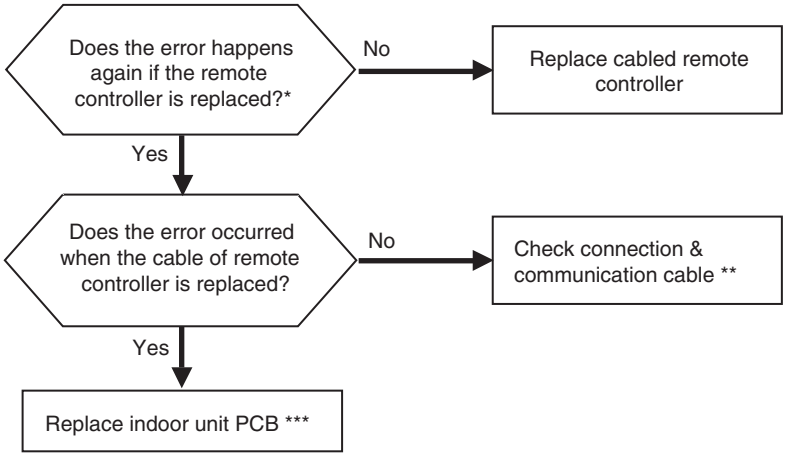
CN-PIPE2 : Pipe outlet temp sensor

CN-PIPE1 : Pipe inlet temp sensor

Measure the resistance of outlet pipe temp sensor.

Error No.	Error Type	Error Point	Main Reasons
03	No communication between cabled remote controller & indoor unit	The remote controller did not receive the signal from indoor unit during specific time	1. Remote controller fault 2. Indoor unit PCB fault 3. Connector fault, Wrong connection 4. Communication cable problem

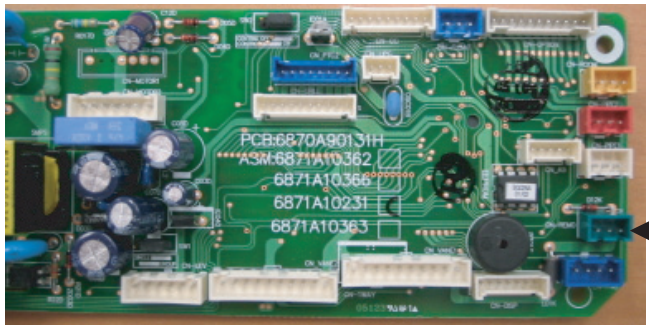
■ Error diagnosis and countermeasure flow chart



* If there is no remote controller to replace : Use another unit's remote controller doing well

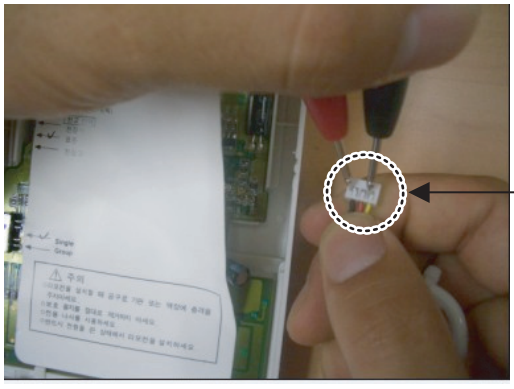
** Check cable : Contact failure of connected portion or extension of cable are main cause
Check any surrounded noise (check the distance with main power cable)
➔ make safe distance from the devices generate electromagnetic wave

*** After replacing indoor unit PCB, do Auto Addressing & input unit's address if connected to central controller.
(All the indoor units connected should be turned on before Auto Addressing



CN-REMO : Remote controller connection

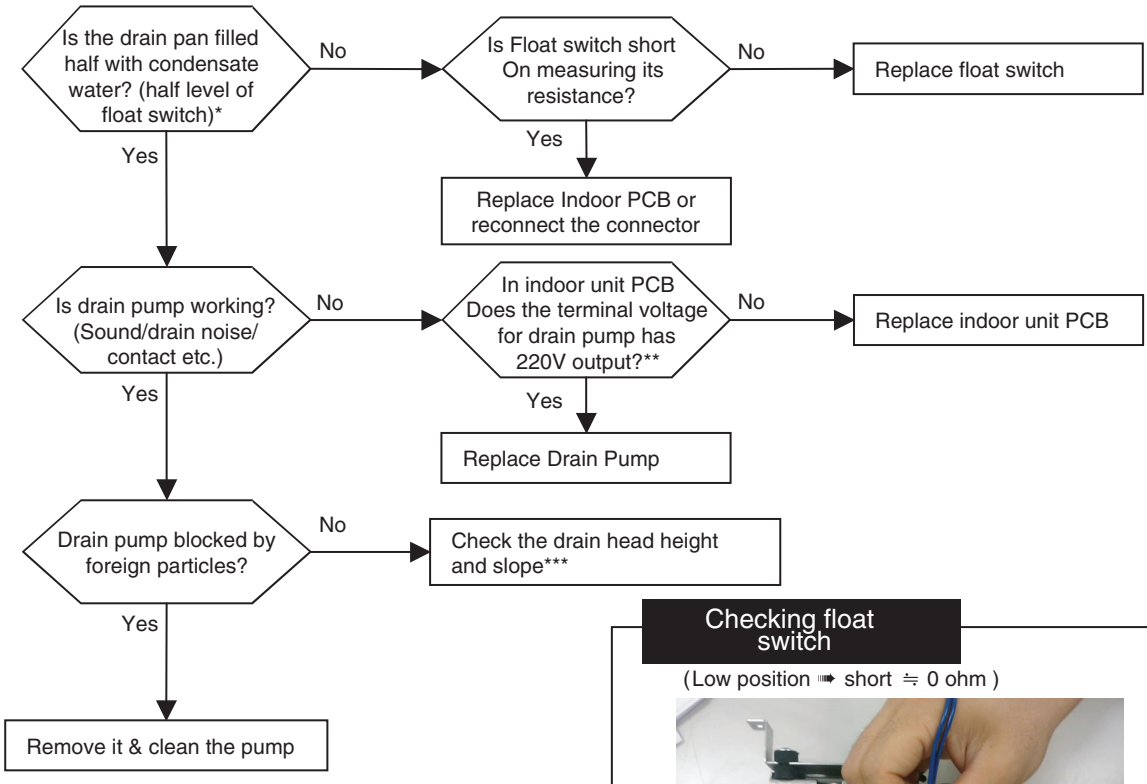
※ The PCB can differ from model to model.
Check from the right source.



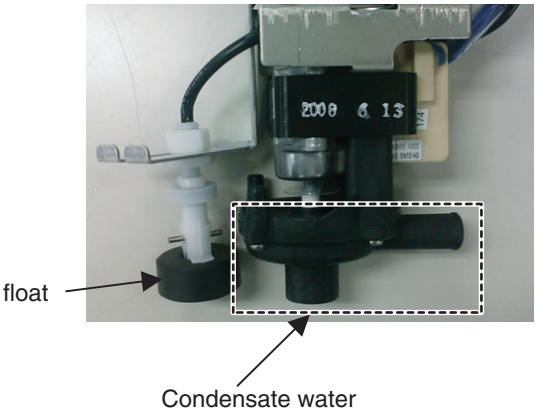
Checking communication cable connection status

Error No.	Error Type	Error Point	Main Reasons
04	Drain pump error	Float switch is open due to rising of condensate water level because of drain pump fault or drain pipe clogging	1. Drain pump/float switch fault 2. Improper drain pipe location, clogging of drain pipe 3. Indoor unit PCB fault

■ Error diagnosis and countermeasure flow chart

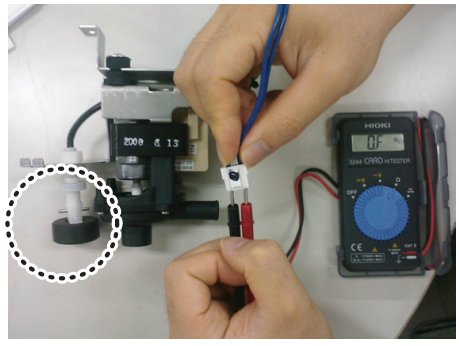


* If the float goes up higher than a half of float switch then the circuit is open & the unit is stopped automatically.

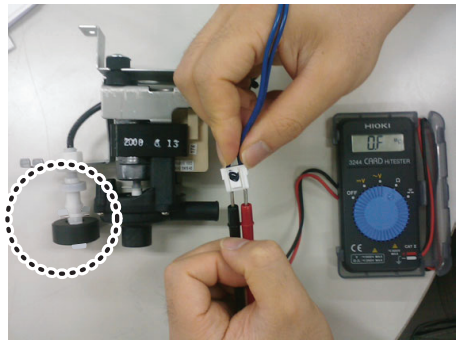


Checking float switch

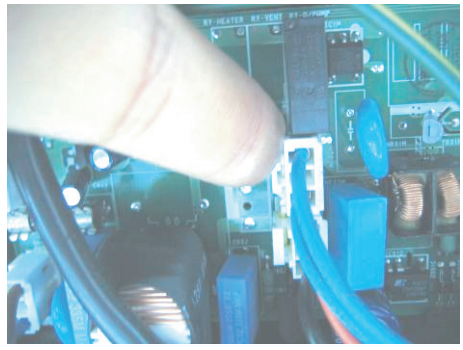
(Low position ➠ short ≒ 0 ohm)



(High position ➠ Open)



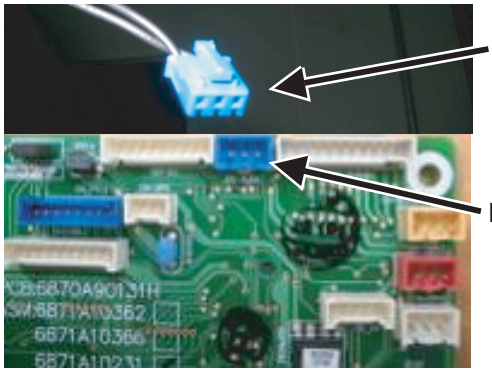
A:Point to check rotating



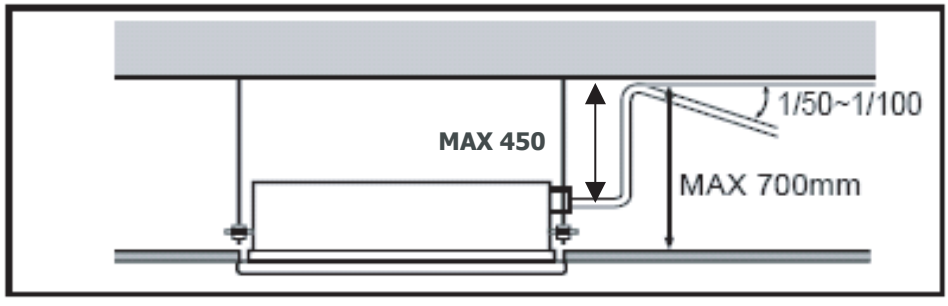
*** Indoor PCB drain pump connector

(Check input of 220V)

(Marked as **CN-DPUMP)**

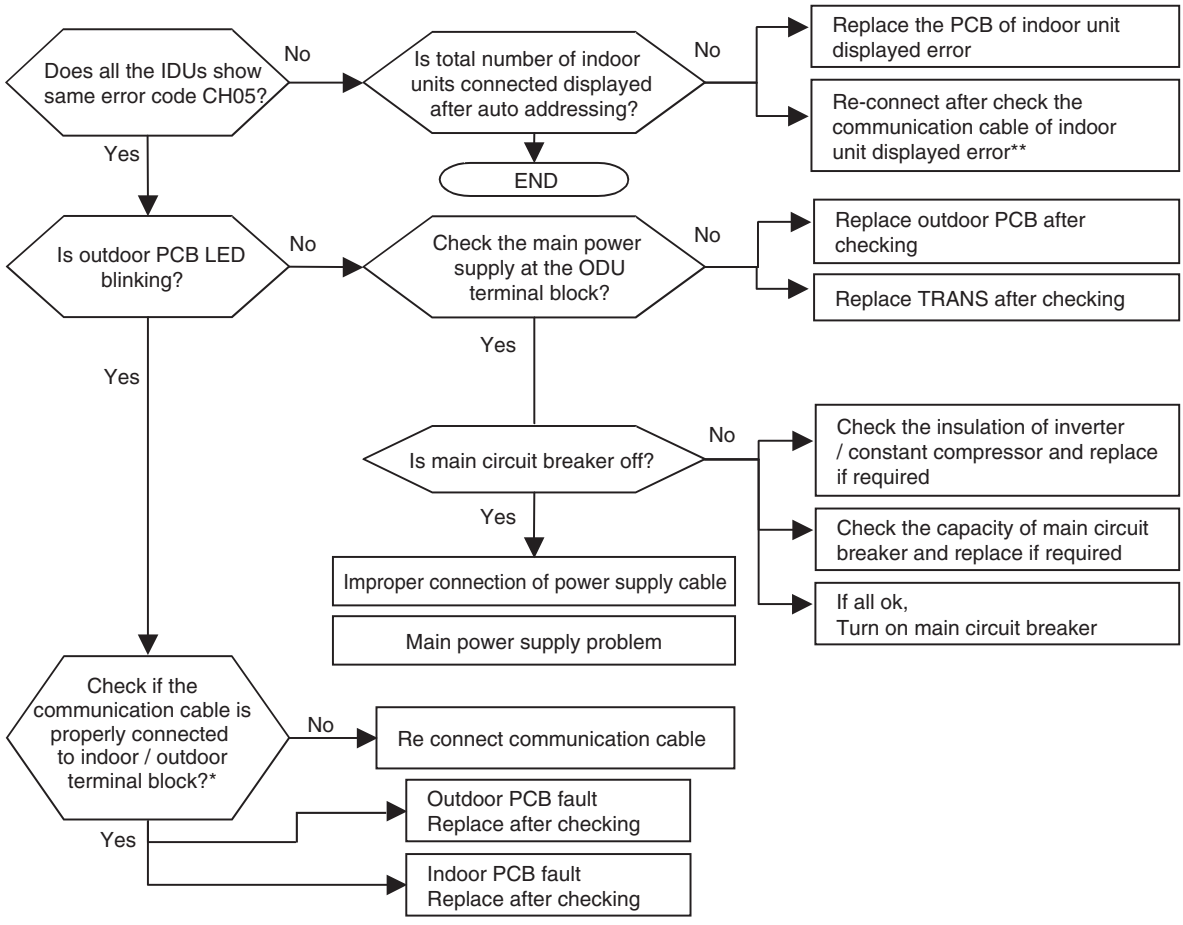


[***] Standard of drain pipe head height / slope

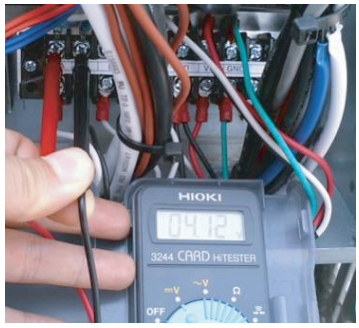


Error No.	Error Type	Error Point	Main Reasons
05	Indoor & Outdoor unit communication error	No signal communication between indoor & outdoor units.	1. Auto addressing is not done 2. Communication cable is not connected 3. Short circuit of communication cable 4. Indoor unit communication circuit fault 5. Outdoor unit communication circuit fault 6. Not enough distance between power and communication cable?

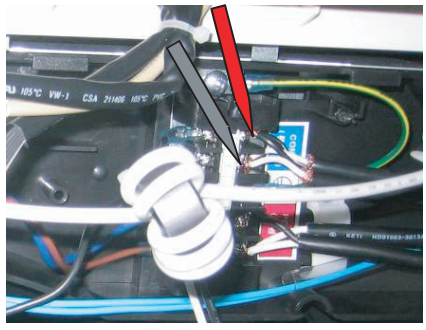
■ Error diagnosis and countermeasure flow chart



* (Note1) communication from IDU is normal if voltage fluctuation(-9V ~ +9V) exists when checking DC voltage of communication terminal between IDU and ODU



* If the DC voltage between communication terminal A, B of indoor unit is fluctuate within (-9V~+9V) then communication from outdoor unit is normal



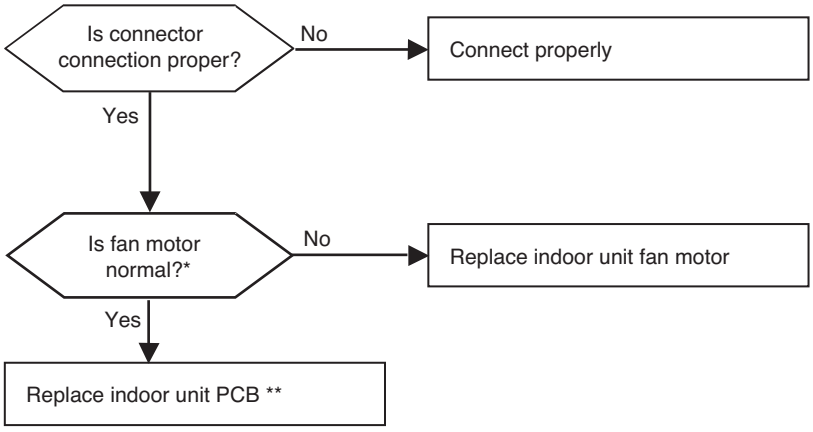
Error No.	Error Type	Error Point	Main Reasons
09	Indoor unit EEPROM error		1. Error developed in communication between the micro- processor and the EEPROM on the surface of the PCB. 2. ERROR due to the EEPROM damage

■ Error diagnosis and countermeasure flow chart

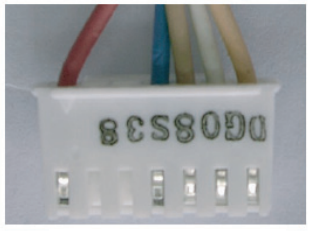
- Replace the indoor unit PCB, and then make sure to perform Auto addressing and input the address of central control

Error No.	Error Type	Error Point	Main Reasons
10	Indoor unit BLDC fan motor failure	Indoor BLDC fan motor feedback signal is absent (for 50 sec.)	1. Motor connector connection fault 2. Indoor PCB fault 3. Motor fault

■ Error diagnosis and countermeasure flow chart



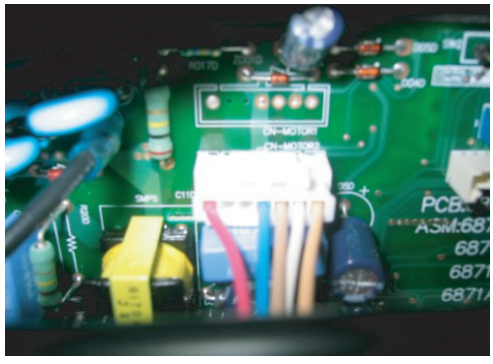
* It is normal when check hall sensor of indoor fan motor as shown below



Each termainl with the tester

Tester		Normal resistance(10%)	
+	-	TH chassis	TD chassis
①	④	∞	∞
⑤	④	hundreds kΩ	hundreds kΩ
⑥	④	∞	∞
⑦	④	hundreds kΩ	hundreds kΩ

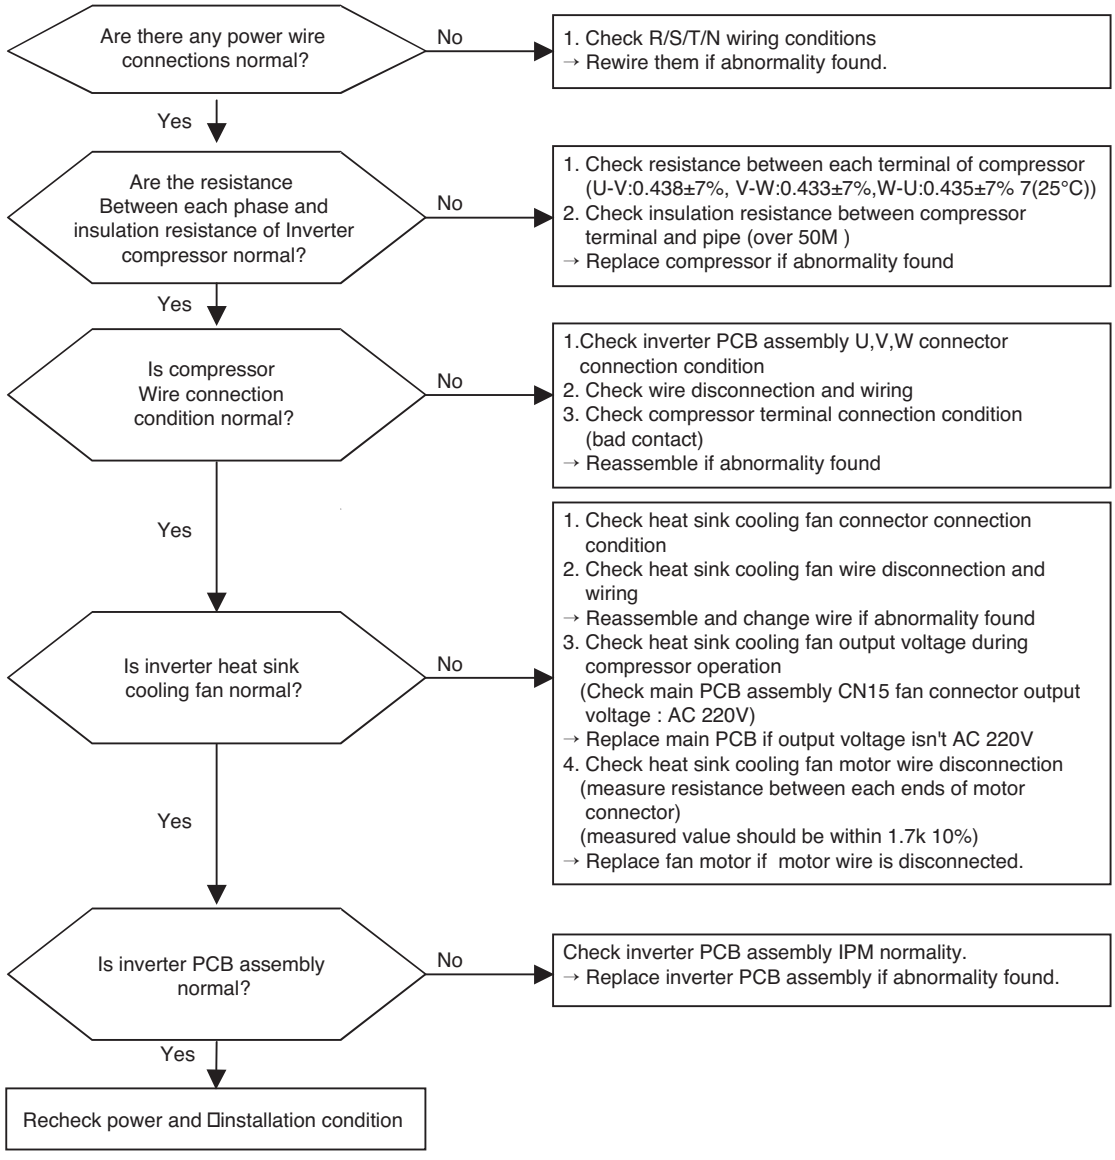
<Checking connection state of fan motor connector>



** Replace the indoor unit PCB, and then make sure to do Auto addressing and input the address of central control
(Notice: The connection of motor connector to PCB should be done under no power supplying to PCB)

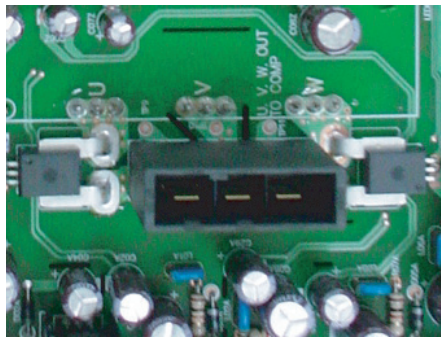
Error No.	Error Type	Error Point	Main Reasons
21* Master 211 Slave1 212 Slave2 213	Inverter PCB Assy IPM Fault occur	IPM self protection circuit activation (Overcurrent/IPM overheating/Vcc low voltage)	1.Over current detection at Inverter compressor(U,V,W) 2.Compressor damaged (insulation damaged/Motor damaged) 3.IPM overheating (Heat sink fan damaged/Heat sink fan connector disconnected/Heat sink disassembled) 4.Inverter compressor terminal disconnected or loose 5.Inverter PCB assembly damaged 6.ODU input current low

■ Error diagnosis and countermeasure flow chart

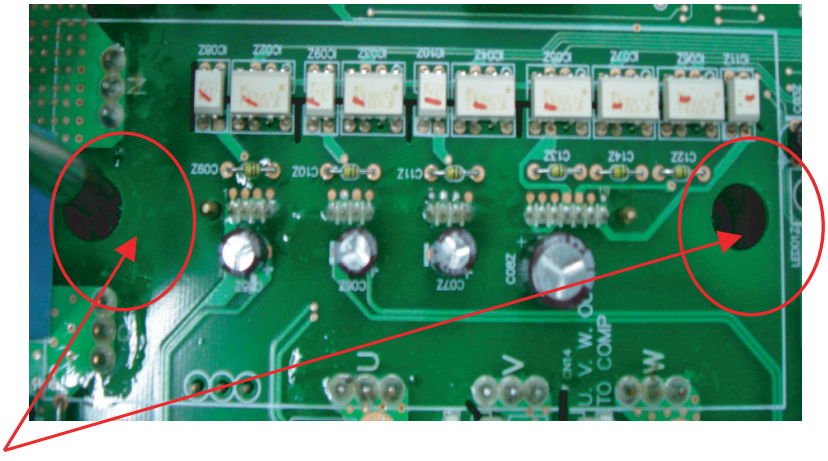


* Measuring resistance between each terminal of compressor

* Compressor wire connector connection point



* IPM joining point



Check joining conditon

Error No.	Error Type	Error Point	Main Reasons
22* Master 221 Slave1 222 Slave2 223	AC Input Current Over Error	Inverter PCB Assembly input 3 phase power current is over limited value(22A)	1. Overload operation (Pipe clogging/Covering/EEV defect/Ref. overcharge) 2. Compressor damage(Insulation damage/Motor damage) 3. Input voltage low 4. Power Line Misconnection 5. Inverter PCB Assembly damage (Input current sensing part)

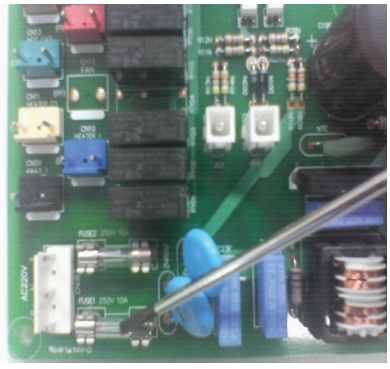
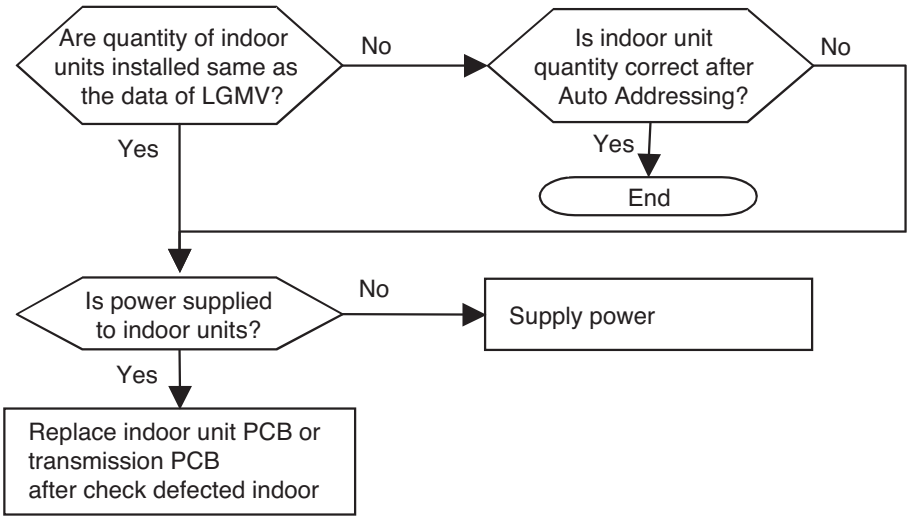
communication connector & LED in inverter compressor PCB



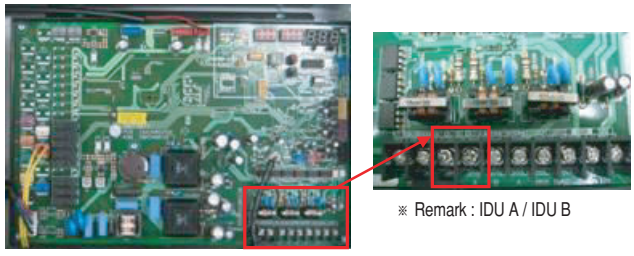
Main PCB Fuse

Error No.	Error Type	Error Point	Main Reasons
53	Communication error (Indoor unit ➔ Main PCB)	In case Main PCB can't receive signal from indoor unit	1. Communication cables are not connected 2. Communication cables are short / open 3. Defect of outdoor Main / indoor PCB 4. ODU/IDU Main PCB Damage. 5. communication Wire Connection Fault.

■ Error diagnosis and countermeasure flow chart



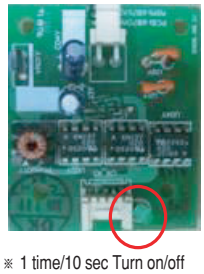
Communication part



※ Remark : IDU A / IDU B

Wiring Fault Case

Indoor Unit Communication PCB



※ 1 time/10 sec Turn on/off

In case of CH53, almost happened with CH05, the indoor units not operated actually are normal so check with same method of CH05. and additionally check as shown as below and above flow chart

- Although the quantity of indoor units installed is same as LGMV data there may be a few indoor units with which the number of communication is not increased with LGMV
- Although the quantity of indoor units installed is not same as LGMV data, and if communication of the indoor unit displayed at LGMV is done well then the indoor unit suspected to have some problem (and is not appear at LGMV) may have following problems
  ① wrong connection of communication cable or power cable
  ② fault of power / PCB / communication cable
  ③ duplication of indoor unit number
- If communication is not doing well wholly then the Auto Addressing is not done
- The case that CH53 appear at indoor unit also Auto Addressing is not done so indoor unit address may be duplicated

* After replacement of indoor unit PCB, Auto Addressing should be done, if central controller is installed then the central control address also should be input.
  In case that only communication PCB is replaced above process is not needed

Error No.	Error Type	Error Point	Main Reasons
54* Master 541 Slave1 542 Slave2 543	Wrong connection of 3Ø power supply cable (Reverse direction / missing a phase)	Wrong connection of 3Ø power supply cable (Reverse direction / missing a phase)	1. Main PCB defect 2. No power of R,S,T supplied 3. Wring connection of R,S,T cables 4. Main Pcb Fuse failure

■ Error diagnosis and countermeasure flow chart

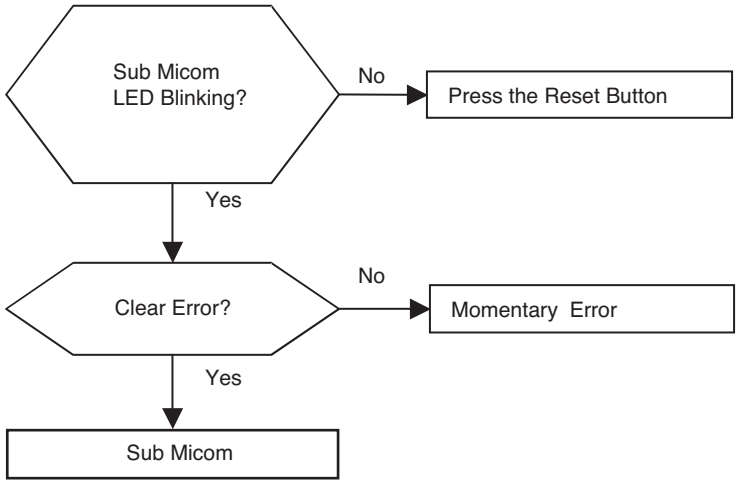
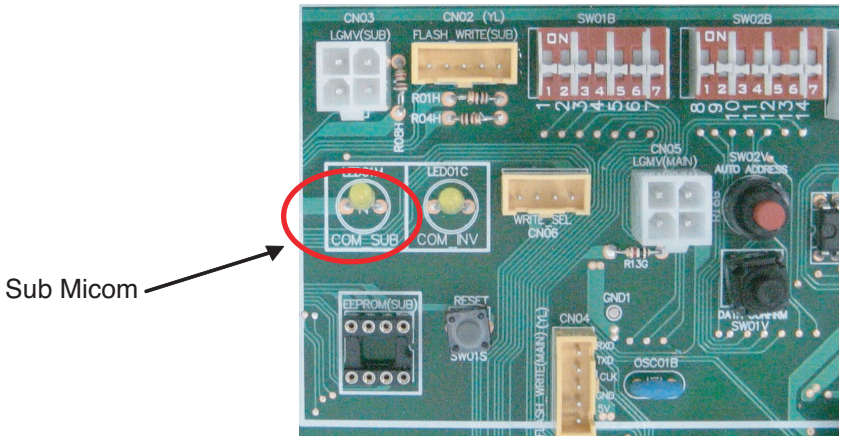
* cables connection between constant compressor and magnetic switch

Error No.	Error Type	Error Point	Main Reasons
182* Master 11-> 821 Slave1 12-> 822 Slave2 13-> 823	Communication Error Between Main-Sub Micom of Master Outdoor unit Main PCB	Failure Receiving Signal Between Main-Sub Micom of Master Outdoor unit Main PCB	1. Failure Receiving Signal Between Main-Sub Micom of Master Outdoor unit Main PCB

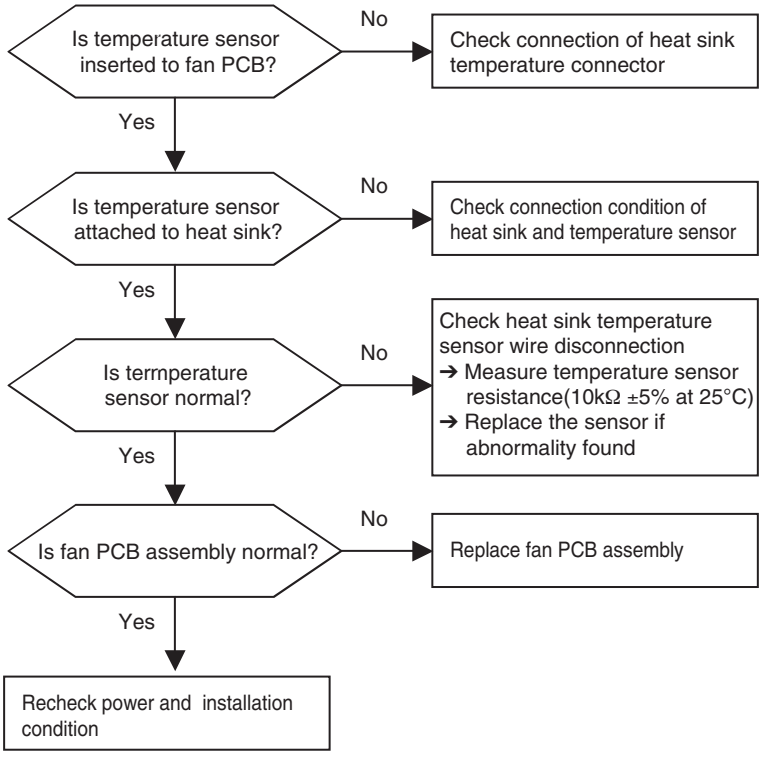
■ Error diagnosis and countermeasure flow chart



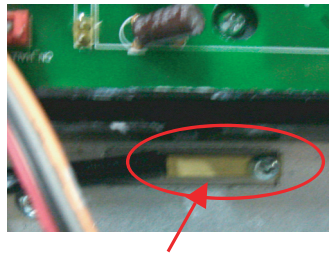


Error No.	Error Type	Error Point	Main Reasons
193* Master 11 → 931 Slave1 12 → 932 Slave2 13 → 933	Fan PCB heatsink temperature high	Heat sink temperature is over 95°C	1. Heatsink temperature sensor defect 2. Fan PCB assembly defect
194* Master 11 → 941 Slave1 12 → 942 Slave2 13 → 943	Fan PCB heatsink temperature sensor error	Heatsink temperature sensor abnormal	1. Heatsink temperature sensor defect(Open/Short) 2. Wrong connection of temperature sensor connector 3. Fan PCB assembly defect

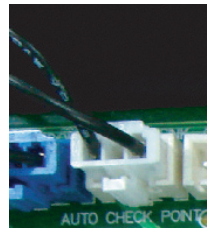
■ Error diagnosis and countermeasure flow chart



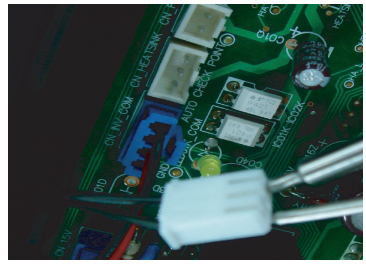
Fan heat sink connection



Check connection condition

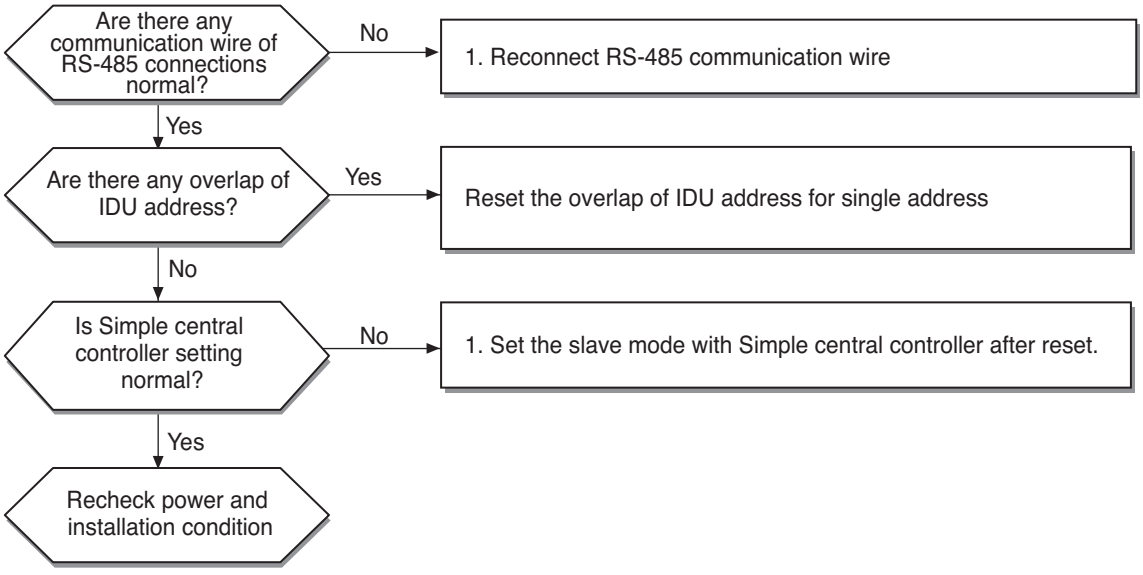


Checking temperature sensor disconnection

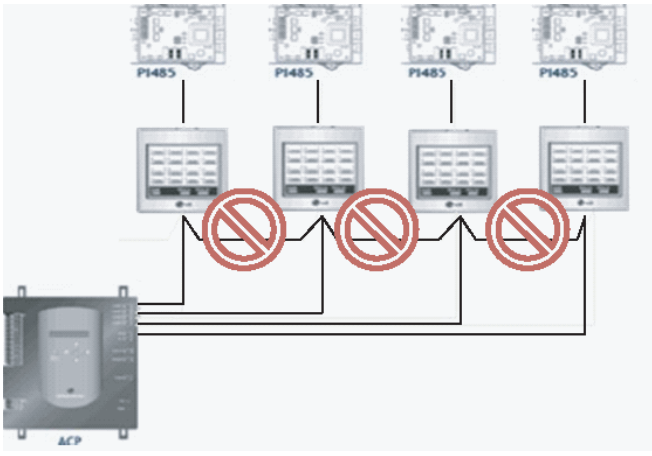


Error No.	Error Type	Error Point	Main Reasons
242	Network Error	Network error of central controller	1. RS-485 communication wiring defect 2. Communication defect between remote controller and indoor unit 3. RS-485 dip switch setting error 4. Indoor unit addressing ssetting error on central controller

■ Error diagnosis and countermeasure flow chart



<RS-485 communication wire miss connection>



P/NO : MFL54555527
